## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Dei vari Osservatori costituenti la Rete Meteorologica del Magistrato alle Acque si pubblicano le osservazioni di alcuni soltanto, scelti in modo da dare un'idea sull'andamento dei principali fenomeni meteorologici della Regione che hanno interesse più o meno diretto con l'Idrologia. Gli stessi criteri hanno servito per la scelta delle stazioni termometriche.

Le osservazioni nella Rete del Magistrato alle Acque si eseguono alle ore 8, 14 e 19 T. M. E., in accordo con l'orario internazionale per le osservazioni sinottiche.

Tutti gli Osservatori sono muniti di strumenti registratori, e alle ore indicate si fanno le letture, tanto ad essi, come agli strumenti a lettura diretta, in modo da apportare in seguito le correzioni del caso.

*Gli strumenti registratori* da cui si fanno gli spogli sono:

*per la pressione:* il barometrografo Agolini;

*per la temperatura:* il termografo, e *per l'umidità:* l'igrografo, tutti e due della ditta Richard;

*per il vento:* l'anemografo Steffens - Marini, ovunque, tranne all'Osservatorio di Treviso e quello del Lido, ove lo spoglio è desunto da un anemografo ad 8 direzioni del Richard;

*per le precipitazioni:* pluviografo Palazzo, oppure tipo M dell'Ufficio Idrografico.

Negli Osservatori principali sono in funzione anche altri tipi di registratori, ai quali si ricorre per l'eventuale interpolazione dei dati, nel caso d'interruzione agli strumenti comuni.

Gli strumenti, tarati all'atto della distribuzione, vengono di quando in quando verificati e controllati.

**Per tutti gli elementi meteorologici, di cui si dà conto nella presente parte «Meteorologia», a differenza di quello che si fa nell'altra parte «Pluviometria», si adotta il giorno civile dalle 0 alle 24.**

Dei diagrammi del termografo, igrografo, barografo si fa lo spoglio, ossia la lettura delle ordinate, ogni due ore.

La media relativa viene calcolata con la formula:

$$m = \frac{1}{12}(l_0 : 2 + l_2 + l_4 + \ldots + l_{22} + l_{24} : 2)$$

Alla media così calcolata si apporta la *correzione* ricavata dal diagramma delle correzioni, ottenuto portando sulle ascisse le letture fatte sul registratore, e sulle ordinate le correzioni dedotte dai confronti con le osservazioni agli strumenti a lettura diretta. Tale metodo si è trovato più rapido e più opportuno di quello di applicare giorno per giorno la correzione ricavata, oppure alla media dell'elemento la media aritmetica delle correzioni.

Per il *vento* si fa lo spoglio ogni ora.

Nella relativa colonna *è segnata la direzione prevalente del vento*, ossia la direzione secondo la quale esso ha soffiato per un maggior numero di ore durante la giornata.

La *media giornaliera* della velocità del vento, espressa in km. ora, è calcolata secondo la formula:

$$m = \frac{1}{24}(l_1 + l_2 + \ldots + l_{23} + l_{24})$$

Per due Osservatori, Belluno, Vicenza e per quelli di II° ordine, non ancora forniti di anemografo, la direzione e forza del vento sono stabilite a stima dall'osservatore.

Per ogni Osservatorio viene pubblicato la massima e minima temperatura giornaliera.

La *nebulosità* è espressa in decimi di cielo coperto, ed è la media aritmetica delle tre osservazioni.

*Note meteorologiche del mese.* — Vengono suggerite dall'esame dei dati raccolti negli Osservatori meteorologici e nelle Stazioni pluviometriche del Compartimento, e delle carte isobariche che si pubblicano nel Bollettino giornaliero dell'Ufficio; queste carte vengono talvolta rettificate in base alle pubblicazioni degli Uffici Meteorologici italiani ed esteri.

I numeri romani preceduti o no dalla parola - tipo - si riferiscono alla classificazione del Fabris (1) alla quale sono state portate leggere modifiche specialmente nei riguardi dei tipi III, XV e XVII.

I valori medi dei vari elementi meteorologici sono stati desunti in generale dai lavori del Prof. F. Eredia pubblicati negli Annali dell'Ufficio Centrale di Meteorologia e Geodinamica di Roma e si riferiscono ad oltre un trentennio di osservazioni. Soltanto per il Venda i valori medi sono stati dedotti da un decennio di osservazioni.

### SEGNI CONVENZIONALI

● Pioggia. - ✳ Neve. - △ Nevischio. - Gragnuola - ▲ Grandine. - ≡ Nebbia. - !≡ Nebbia piovigginosa. - ≡ Nebbia all'orizzonte. - V Brina. - ⌴ Gelo. - ∾ Gelicidio. - ⌓ Rugiada. - -- Aghi di ghiaccio. - ∞ Caligine. - Ꝁ Temporale. - T Temporale lontano. - < Lampi senza tuoni. - ≷ Lampi e tuoni. - ⸸ Vento forte. - ⸸ Vento fortissimo. - ∔ Uragano di neve. - ⊖ Alone solare. - ( Alone lunare. - ⊕ Corona solare. - (ȩ Corona lunare. - ⌒ Arcobaleno.

—, calma, o nessuna precipitazione;

», non giunte le osservazioni; dato mancante o non calcolato;

?, dato incerto;

(·), dato desunto dallo strumento a lettura diretta, invece che dal registratore; se il segno è messo in testa ad una decade, vale per tutti i dati successivi di quella decade;

··, dato interpolato o calcolato in base ad osservazioni interpolate;

Le lettere a p n, che seguono alcuni segni (quei di nebbia, pioggia, neve, grandine, temporale, lampi, tuoni), indicano la parte del giorno (rispettivamente dalle ore 8 alle 12, dalle 12 alle 19 e dalle 19 alle 8), in cui il fenomeno si è verificato.

Se il segno di pioggia, neve, nebbia non è seguito da *nessuna lettera*, vuol dire che il fenomeno ha durato tutto il giorno.

**Avvertenze.** — I valori massimo e minimo dei singoli elementi per ogni decade sono indicati col carattere grassetto.

(1) C. Fabris — Tipi isobarici principali e loro azione sull'Italia — Lit. del Serv. Aer. — 1917.

# Note meteorologiche del mese di Gennaio

(Redatte dal Prof. Dott. G. Crestani)

1. La *media mensile della temperatura* è ovunque inferiore al valor medio dedotto da molti anni, la differenza è forte come quella che ovunque supera i due gradi, raggiungendo 3°,7 al Venda e 4°,1 a Belluno.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Venda | Rovigo | Vicenza | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Genn. 1929 | -0,9 | 2,0 | 0,6 | -5,1 | 0,0 | 0,4 | -1,1 | -1,4 | -1,0 | -0,4 | -3,1 | -3,2 |
| Val. medio | 1,9 | 4,3 | 3,2 | -1,0 | 2,4 | 2,6 | 1,6 | 2,3 | 1,6 | 1,6 | -0,3 | 0,0 |

2. La temperatura, nel suo andamento generale, ha avuto tre oscillazioni, i cui minimi si sono presentati: l'uno poco dopo il 10, l'altro poco dopo la metà del mese; il terzo verso la fine; in quest'epoche caddero i minimi assoluti per le singole località a seconda che le condizioni locali favorirono o meno l'abbassamento generale della temperatura. Così nel bacino dell'Adige e sulle Prealpi il minimo assoluto del mese si verificò tra il 12 e il 13; nei luoghi elevati e in quelli esposti alla bora si verificò tra il 17 e il 18: al 17 al Venda con -6°,9, a Trieste e nell'Istria. Al 29 il minimo assoluto si presentò in tutta la pianura coperta di neve, con cielo sereno e vento molto debole; a Padova -15°,6 (temperatura così bassa non ancora raggiunta dall'Osservatorio dalla sua fondazione che avenne nel 1920), Venezia -6°,1; questa risente le conseguenze del freddo retroterra.

La massima assoluta era stata segnata ai primi giorni del mese in pianura (al 5 a Padova 8°,6, a Venezia 7°,0), al 20-21 in qualche località sui monti, al 30-31 lungo la vallata dell'Adige, nell'Istria e a Trieste; al 30 al Venda con 6°,9.

L'escursione termica del mese fu 13°,8 al Venda, 13°,1 a Venezia, 24°,2 a Padova.

3. In 21 giorni (il 6, dall'8 al 23, e dal 28 al 31) la minima diurna della temperatura al Venda fu superiore di quella a Padova; in 4 giorni (il 6, il 13, 14, 30) anche la massima diurna della temperatura al Venda fu superiore di quella a Padova; ciò ci denota l'esistenza in tutti questi casi di un'inversione termica tra Padova e Venda. La differenza di temperatura tra le minime delle due località raggiunse valori fortissimi, specie negli ultimi quattro giorni del mese dal 28 al 31; la minima al 29, per es., a Padova fu -15°,6, al Venda -3°,8, differenza 11°,8; al 30 a Padova -13°,2, al Venda 0°,6, differenza 13°,8. Il suolo coperto di neve, il cielo sereno, il vento debole, la secchezza dell'aria (media diurna dell'umidità relativa al 30 a Padova 74, al Venda 27) danno la spiegazione del fenomeno.

La media della seconda e terza decade nelle località in pianura (Venezia, Padova, Rovigo, ecc.) è sotto zero, l'altra media di pochi gradi supera lo zero, cosicchè nella seconda e terza decade è lecito ritenere la *isoterma zero* al livello del mare; nella prima decade essa è appena di qualche centinaio di metri sopra tale livello.

Nella zona montuosa frequenti e numerosi le inversioni termiche; inoltre sino ai 2000 m. la diminuzione della temperatura è molto piccola, appena di qualche grado; oltre i 2000 m. pare che il gradiente s'accosti al valor normale a quelle quote.

4. Continua fino al giorno 5 il *periodo piovoso*, iniziatosi al 28 del mese precedente, precipitazioni generali nei primi quattro giorni del mese, parziali nell'ultimo.

Un periodo asciutto decorre dal 6 al 23, durante il quale si hanno poche precipitazioni sull'Istria il 14; le precipitazioni riprendono per soli 4 giorni, dal 24 al 27, generali nei primi tre, parziali negli ultimi.

Le precipitazioni furono ovunque molto deboli, e allo stato di neve; le poche piogge in pianura portarono deboli incrementi negli idrometri in piano del Livenza, e dell'Agno-Guà.

5. Il *manto nevoso* subisce un rifornimento nei primi giorni: il 2 lo spessore è di cm. 175 a Monteneve (m. 2332), di circa 100 cm. verso i duemila metri. Nei giorni successivi lo spessore del manto nevoso diminuisce, lentamente però; probabilmente per costipamento.

Riprendono le nevicate verso la fine del mese; al 26 è raggiunto un nuovo massimo dello spessore del manto con cm. 188 a Monteneve, leggermente superiore ai 100 cm. verso i 2000 metri.

Nei rimanenti giorni lo spessore del manto diminuisce nuovamente, ma solo di pochi centimetri.

6. La *nebulosità media* di questo mese, in generale, è inferiore al valor medio dedotto da molti anni, tranne nell'Istria, di cui la causa va probabilmente ricercata nel maggior numero di nebbie:

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Rovigo | Vicenza | Trento | S. Michele | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Genn. 1929 | 5,1 | 4,1 | 3,5 | 3,1 | 4,4 | 5,2 | 4,9 | 5,4 | 3,6 | 3,6 | 2,9 | 3,6 |
| Val. media | 4,7 | 6,4 | 6,0 | 5,0 | 5,5 | 5,2 | 5,4 | 6,7 | 4,9 | 4,7 | 3,6 | 3,6 |

7. Dall'ispezione della *carta delle precipitazioni* appare una zona di leggero massimo che stendesi attorno a Vicenza sino alle prealpi con valori tra 100 e 130 mm. Sono stati superati i 100 mm. nel bacino dell'alto Tagliamento e in qualche zona qua e là nelle Prealpi Giulie, senza mai toccare i 200 mm. in nessuna località.

In quasi tutto il bacino del Medio e Alto Adige le precipitazioni sono inferiori ai 25 mm.; nella Pianura Veneta esse sono tra i 70 e gli 80 mm.

Questa caratteristica configurazione della carta isoietica trova la sua spiegazione nei tipi isobarici che hanno apportato le precipitazioni in questo mese. Infatti in tutti e due i periodi tanto quello ai primi giorni del mese, come quello verso la fine abbiamo avuto tipi isobarici in cui il ciclone dal Mediterraneo occidentale si è allontanato attraverso il Mar Tirreno, l'Italia meridionale, muovendo verso il Mar di Levante (§ 11).

8. Il *rapporto tra il totale delle precipitazioni* cadute in questo mese nelle singole località e il valor medio dedotto da molti anni supera l'unità nella pianura, è inferiore all'unità nella zona montuosa, come appare dal seguente specchietto.

| | Pisino | Trieste | Gorizia | Plezzo | Belluno | Conegliano | Treviso |
|---|---|---|---|---|---|---|---|
| Genn. 1929 | 59,0 | 55,4 | 41,0 | 115,7 | 40,0 | 97,9 | 89,9 |
| Valore medio | 72,5 | 60,6 | 76,0 | 108,2 | 50,6 | 57,4 | 56,1 |
| Rapporto | 0,81 | 0,91 | 0,54 | 1,1 | 0,79 | 1,71 | 1,60 |

| | Venezia | Padova | Rovigo | Vicenza | Recoaro | Trento | S. Michele | Bolzano | Silandro |
|---|---|---|---|---|---|---|---|---|---|
| Genn. 1929 | 43,0 | 82,6 | 49,2 | 110,4 | 84,4 | 15,4 | 22,1 | 18,3 | 9,3 |
| Valore medio | 39,2 | 43,4 | 43,7 | 74,2 | 113,0 | 40,4 | 38,8 | 24,7 | 24,0 |
| Rapporto | 1,10 | 1,90 | 1,13 | 1,52 | 0,75 | 0,38 | 0,57 | 0,70 | 0,35 |

9. Tranne il giorno 3, in tutti gli altri giorni della prima decade a Trieste il *vento* ha infuriato dal 1° quadrante (bora), tanto che la media decadica della media diurna della velocità del vento è km. 37,7; nel giorno 2 la media diurna è stata 49,0, al 7 km. 47,7, all'8 km. 47,5; il massimo percorso orario si verificò il giorno 8 con km. 79 dalle ore 6 alle 7.

A Venezia, oltre che il giorno 3 anche il 5 e il 6, il vento s'allentò alquanto, ad ogni modo la media decadica fu km. 24,1 con una massima media diurna di km. 38,9 al 2.

Al Venda mancano le osservazioni del 2 e del 3; all'1 si ebbe la media diurna massima con km. 41,9; nei giorni 4-7-8 la media toccò e superò i 35 km. ora.

Nella seconda decade ci sono tre giorni di bora a Trieste e al Venda (14-15-17); a Venezia non furono suparati i 20 km. in quei giorni.

Nella terza decade furono giorni molto ventosi al Venda il 25-31, a Venezia il 25-26-31, anzi qui al 25 fu raggiunta la media diurna massima del mese con km. 40,9. A Trieste furono oltrepassati i 20 km. il 25-26-27-28-29-31 con la massima media diurna al 26, che fu di km. 56,7 e il massimo percorso orario del mese con km. 87 dalle ore 5 alle 6.

Dall'esame della *rosa dei venti* a 16 direzioni, costruita con lo spoglio orario delle registrazioni dell'anemografo risulta:

A Fiume la maggiore frequenza delle direzioni è compresa tra ENE e NNW (82 %, a 5 direzioni) con due massimi, uno a ENE (26 %) e l'altro a N (17 %).

A Trieste la rosa si raccoglie quasi tutta nel settore che va da SE a ENE (86 % a 4 direzioni) con un massimo di 36 % a ENE.

A Venezia le direzioni più frequenti sono comprese nel settore che va da ENE a NNW (80 %, a 5 direzioni), con un massimo (38 %) a N.

Al Venda mancano quasi del tutto le direzioni da SW a E, difatti ad esse spetta 7 % a 7 direzioni, le altre direzioni si raggruppano in due settori, uno occidentale, con un massimo a WNW (8 %), l'altro orientale col massimo a NE (20 %).

A Padova mancano quasi del tutto le direzioni del settore che va da SSW a ENE (5 % a 7 direzioni); le direzioni più frequenti sono nel settore che va da W a NE (87 %), con un massimo a WNW (18 %) e con un minimo a NNW (5 %).

A Trento la rosa ha la sua solita forma invernale, ossia le direzioni sono quasi tutte raccolte nel settore che va da NW a NE (83 %, a 5 direzioni) con un massimo a NNW (32 %).

10. La *media mensile della pressione atmosferica* è alquanto superiore al valor normale; l'altezza barometrica di questo mese a Venezia è stata di mm. 765,2, mentre il valor normale è mm. 764,3; dunque una differenza in eccesso di mm. 0,9.

L'estremo più alto dell'altezza barometrica a Venezia è stato di mm. 779,4 alle $23^h$ del 9; l'estremo più basso è stato di mm. 747,3 alle $17^h$ del 16; dunque un'escursione mensile di mm. 32,1, leggermente inferiore a quella del mese precedente, ma pur sempre superiore al suo valor medio nella regione, che s'aggira attorno ai mm. 28.

Fra le salite del barometro più notevoli sono a noverare: quella dai mm. 750,2 delle $8^h$ del 26 ai mm. 772,4 delle $12^h$ del 29, mm. 22,2 in 76 ore, pari a mm. 0,29 all'ora, e quella di mm. 747,6 delle $20^h$ del 16 ai mm. 758,9 delle $12^h$ del 17, mm. 11,3 in 16 ore, pari a mm. 0,71 all'ora.

Tra le discese del barometro più notevoli vanno noverate quella dai mm. 772,9 delle $4^h$ del 22 ai mm. 749,6 delle $14^h$ del 25, mm. 23,3 in 82 ore, pari a mm. 0,28 all'ora, e quella dai mm. 771,8 delle $10^h$ del 13 ai mm. 761,4 delle $8^h$ del 14, mm. 10,4 in 22 ore, pari a mm. 0,47 all'ora.

11. L'unito specchietto mostra i *tipi isobarici* presentatisi al mattino alle ore 8 e le *condizioni di tempo* nei riguardi delle precipitazioni da cui essi furono accompagnati nel corso della giornata (da una mezzanotte all'altra).

| Tipi | I | II | IV | V | VIII | IX | X | XII | XIV | XV | XVIa | XVIb | XVIIa | XVIIb | XVIII | Totale |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Con precipit. generali | — | — | — | — | — | — | — | — | — | 3 | 3 | 1 | — | — | — | 7 |
| Con precipit. parziali | — | — | — | — | — | — | — | — | — | — | — | — | 1 | — | 1 | 2 |
| Senza precipitazioni | 7 | 1 | 1 | 1 | 1 | 2 | 2 | 2 | 2 | — | — | — | 1 | 2 | — | 22 |
| Totali | 7 | 1 | 1 | 1 | 1 | 2 | 2 | 2 | 2 | 3 | 3 | 1 | 2 | 2 | 1 | 31 |

Nei due periodi con precipitazioni, segnalati al § 4, la configurazione isobarica fu caratterizzata dalla presenza nel Mediterraneo occidentale di depressioni abbastanza profonde ed ampie nel loro interno.

Il primo periodo termina il 5 quando il ciclone che è passato per l'Italia centrale il 4, si trova nel Mar Jonio (il 5), di dove va nel Mar di Levante (il 6). Intanto l'Europa centrale è sede di un vasto e potente anticiclone il quale si sposta qua e là, senza allontanarsi gran che, sino a che al giorno 12 si raccoglie sull'Europa occidentale lasciando che sull'orientale discenda il ciclone settentrionale che all'11 è nel Mar Bianco, al 13 e 14 nella regione dei laghi russi; intanto al 14 nel Tirreno ha luogo un secondario a mm. 760,0, che nei giorni successivi si approfondisce e poi al 17 è nel Mar Jonio allontanandosi.

Le precipitazioni mancano nella Val Padana e in particolare nelle nostre regioni malgrado il barometro molto basso – alla sera del 16 è stata segnata la minima barometrica del mese – come quelle che si trovano abbastanza lontane dal ciclone settentrionale (solo al 16 è sul Golfo di Danzica a mm. 736,0 arrivatovi però da Nord) e si trovano nella parte settentrionale del ciclone mediterraneo che ha un movimento generale verso SE.

Le precipitazioni riprendono e sono generali nel 24 al costituirsi di un ciclone nel Mediterraneo occidentale, mentre sulla Russia si stendono pressioni elevatissime. Il ciclone mediterraneo si sposta regolarmente verso SE nel giorno 27; quand'esso ha raggiunto l'Italia meridionale poche e parziali sono le precipitazioni; esse mancano del tutto al giorno successivo, quando l'anticiclone atlantico, delineatosi sul Golfo di Guascogna il 27, ha mandato un esteso promontorio a N delle Alpi.

12. Il livello della marea realizzata è notevolmente superiore a quella prevista con l'analisi armonica nei primi 5 giorni del mese; dopo la differenza va attenuandosi ed è quasi nulla dal 9 al 14, tranne il giorno 13 in cui si delinea una differenza di segno opposto alla precedente, (marea reale più bassa della prevista); di tal segno si mantiene dal 5 sino al 24, è di segno opposto dal 25 al 28, ritorna al segno precedente agli ultimi giorni del mese.

Le differenze più notevoli si ebbero nei primi giorni del mese in cui esse superarono più volte i 30 cm. raggiungendo i 38 cm. durante la seconda bassa marea del 2, e la prima bassa marea del 4, i 39 cm. al 25 e al 26.

Le differenze in diffetto più notevoli sono cm. 32 il 22, cm. 39 il 21.

# PLUVIOMETRIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Le tabelle contengono le osservazioni giornaliere ed i totali mensili delle precipitazioni verificatesi a tutte le stazioni della rete del Magistrato, raggruppate per **bacini principali** (o gruppi di bacini principali)

e per **pianure**, limitate dai principali corsi d'acqua della regione e così denominate:

| | |
|---|---|
| **pianura orientale** | *a*) fra Isonzo e Tagliamento |
| | *b*) fra Tagliamento e Piave |
| **pianura occidentale** | *a*) fra Piave e Brenta |
| | *b*) fra Brenta e Adige |
| **pianura polesana** | fra Adige e Po |

In apposita colonna vengono dati inoltre i nomi dei bacini secondari a cui appartengono le stazioni pluviometriche.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni pluviografiche sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dallo strumento a lettura diretta invece che dal registratore.

Le precipitazioni vengono generalmente misurate al mattino, alle ore 9, e assegnate al giorno in cui venne eseguita l'osservazione; comprendono sia la pioggia che la neve fusa.

I dati giornalieri ricavati dai diagrammi pluviografici comprendono le quantità di pioggia registrate dalle ore 9 del giorno precedente alle ore 9 del giorno che si considera.

Per ogni stazione è indicato il numero dei giorni con precipitazioni uguali o superiori ad 1 millimetro.

*Manto nevoso.* — Nella tabella vengono raccolte le altezze giornaliere del manto nevoso in cm. per alcune stazioni; per ogni stazione è segnata in grassetto la massima altezza raggiunta dalla neve durante il mese.

Su quattro cartine allegate al bollettino sono indicate le altezze del manto nevoso per alcune stazioni nei giorni indicati nelle cartine stesse.

In corrispondenza alle stazioni il cui nome per ragioni di spazio è abbreviato sono segnate in nero le quote s. l. m., ed in rosso le altezze della neve osservate in quel giorno.

Le altezze del manto nevoso vengono misurate con un'asta metrica posta nelle immediate vicinanze del pluvionivometro; esse danno quindi l'altezza del manto nevoso soltanto per il punto di misura.

### SEGNI CONVENZIONALI

P, pluviometro a superficie ricevente di $^1/_{10}$ di m.²;
Pn, pluvionivometro id. id. id. id.
Pa, pluviometro a superficie ricevente di $^1/_{20}$ di m.²;
Pv, pluvionivometro id. id. id. id.
Pr, pluviografo;

—, nessuna precipitazione;
*, neve;
•, pioggia;
n, precipitazioni avvenute sotto forma di neve non misurata;

», non giunte le osservazioni; dato mancante;
?, dato incerto;
(·), dato desunto dallo strumento a lettura diretta invece che dal registratore.

Avvertenze. — I valori massimi giornalieri delle precipitazioni sono indicati col carattere grassetto.

# REGIME DEI CORSI D'ACQUA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

**Altezze idrometriche giornaliere.** — Vengono raccolte in questa tabella le osservazioni eseguite agli idrometri principali, in funzione lungo i corsi d'acqua più importanti della regione.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni provviste di idrometrografo sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dalla lettura all'idrometro invece che dal registratore.

Nella II parte (annua) del Bollettino vengono riportate le caratteristiche di tutti gli idrometri della rete del Magistrato.

I valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese.

Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere *ordinario* sono *sopra* lo zero idrometrico, quelle stampate in carattere *minuscolo* e distinte dal segno — posto al di sopra di ognuna di esse, sono *sotto* lo zero idrometrico.

**Deflussi giornalieri e mensili.** — Per le principali stazioni per misure di portata vengono in questa tabella raccolti i valori seguenti: altezze idrometriche giornaliere, portate in mc. al secondo giornaliere e mensili, deflussi giornalieri e mensili.

Per le stazioni con idrometro a lettura diretta si è assunto come valore della portata giornaliera quello che corrisponde all'altezza osservata il giorno stesso all'idrometro di stazione. Per le stazioni fornite di registratore, si è assunta come portata giornaliera, quella corrispondente alla media delle altezze registrate ogni sei ore e, nel caso di notevoli variazioni del livello, quella corrispondente alla media delle altezze orarie.

I valori delle portate desunti dalle relative curve, vengono corretti mediante la curva di Stout, determinata in base alle variazioni verificatesi nelle singole sezioni.

I valori più elevati del mese sono stampati in grassetto, quelli più bassi in corsivo e sottolineati.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato e per secondo, calcolato per le portate massima, minima e media del mese.

**Misure di portata.** — La tabella riporta l'elenco ed i risultati delle misure di portata eseguite nel mese a cura dell'Ufficio. Per ognuna di esse viene indicato il bacino imbrifero in kmq. ed il contributo per kmq. in litri al secondo.

**Materiale in sospensione nell'acqua dei fiumi.** — Viene determinato e pubblicato: per l'**Isonzo** a *Salcano*, per il **Tagliamento** a *Venzone* e *Latisana*, per il **Piave** a *Belluno* (Borgo Piave), per il **Brenta** a *Bassano* e *Codevigo*, per il **Frassine** a *Borgo Frassine*, per l'**Adige** a *Pescantina* e *Boara Pisani*.

### SEGNI CONVENZIONALI

I, idrometro;
Ir, idrometro registratore;
», non giunte le osservazioni; dato mancante;

?, dato incerto;
(•), dato desunto dalle letture all'idrometro invece che dal registratore;
(••), dato interpolato;

°, idrometro o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chiusura dei sostegni di navigazione, oppure dalle manovre degli impianti per derivazione d'acqua.

(*) Nella portata unitaria e integrale è anche considerata la portata del canale di derivazione per l'irrigazione dell'Alto Agro Veronese. Tale portata, variabile continuamente, in quanto è influenzata da numerose chiaviche di presa, non è possibile determinare giorno per giorno. Risulta però trattarsi di portate che non superano mai in autunno-inverno i m.³ 3 ed in primavera - estate i m.³ 16. Calcolando per l'inverno una portata media di 2 m.³ e per la primavera - estate di 15 m.³ veniamo a commettere nel calcolo della portata integrale dell'Adige un errore del tutto trascurabile, in relazione ai limiti di tolleranza che ci siamo proposti nelle misure di portata. Nei valori delle portate e dei deflussi è inoltre considerata la portata, derivata mediante sollevamento meccanico, del canale d'irrigazione di sinistra dell'Adige.

## Misure di portata eseguite nel mese

| N. d'ordine | Bacino principale | Corso d'acqua | Località | Giorno | Idrometro | Altezza idrometrica | Sezione liquida in mq. | Portata m. c. al secondo | Bacino imbrifero in kmq. | Contributo per kmq. in litri |

# GEOIDROLOGIA

Le osservazioni freatiche vengono effettuate dieci volte al mese nei giorni 2 - 5 - 8 - 11 - 14 - 17 - 20 - 23 - 26 - 29, al mattino, prima degli ordinari attingimenti d'acqua.

Le stazioni sono elencate in relazione alla progressiva distanza dall'asse dei corsi d'acqua e procedendo da monte a valle. I nomi stampati in grassetto indicano che la stazione è fornita di apparato registratore dei livelli freatici.

Le quote del pelo d'acqua nei pozzi sono tutte riferite al livello medio del mare. Per la pianura fra Tagliamento e Torre, per quelle del Brenta e dell'Adige le quote dei pozzi sono state desunte dalle tavolette al 25.000 dell'Istituto Geografico Militare e devono pertanto ritenersi approssimate; per gli altri pozzi le quote sono state determinate mediante livellazione geometrica.

**SEGNI CONVENZIONALI**

°, idrometro a lettura diretta o registratore posto in località ov'è sentito l'influsso della marea o delle manovre degli impianti per derivazione d'acqua;
», non giunte le osservazioni, dato mancante;
?, dato incerto.

## Osservazioni freatimetriche e variazioni freatiche in relazione alle condizioni pluvio - idrometriche

(1) In seguito a livellazione di precisione sono modificate, dal 1 Gennaio, le quote di riferimento: pertanto da tale data tutti i valori numerici sono riferiti alle nuove quotazioni.
(2) A Sandrigo al pozzo di Casa Canonica è stato sostituito quello di Casa Matteazzi che inizia il funzionamento il 1 Gennaio: la differenza fra le due quote di riferimento è di — m. 2.61.

# MAREOGRAFIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Tutte le altezze di marea pubblicate nel bollettino sono espresse in centimetri e riferite ad una superficie ideale di base situata a m. 1.50 sotto il livello medio del mare, origine della rete altimetrica dello Stato, (si ottengono così nelle altezze di marea valori sempre positivi).

Le letture dirette delle altezze di marea, per il controllo del funzionamento degli apparati registratori, sono effettuate a partire da uno speciale bullone (caposaldo) quotato mediante collegamento di precisione coi caposaldi della rete altimetrica suddetta.

Le altezze di marea di Trieste invece sono riferite, da questo mese in poi, ad un piano ideale posto a 150 cm. sotto il livello medio determinato dal Prof. Hopfner sulla base dei dati orari del 1911. Tale livello medio si trova a cm. 252.9 sotto il caposaldo verticale dell'I. G. M., fissato alla parete interna NE della cabina mareografica.

Per riferire al suddetto piano ideale tutti i dati pubblicati nei bollettini dell'Ufficio Idrografico dal luglio 1926 a tutto dicembre 1928 si devono aumentare i dati stessi di 5 cm.

In tal modo possiamo dare le altezze di marea riferite al livello medio del mare, che abbiamo assunto come fondamentale in prima approssimazione, in attesa di stabilirlo definitivamente, in base a lunghe serie di osservazioni mareografiche.

I tempi sono calcolati sul tempo medio Etneo (T. M. E. C.).

Le stazioni mareografiche, delle quali si pubblicano i dati, sono state scelte:

Tabelle I e II. — Per lo studio del fenomeno di marea nell'Adriatico: Marano Lagunare, Porto Falconera, Diga Sud del Porto di Lido, San Felice di Chioggia (entro il Porto di Chioggia); Trieste, Ancona, Viesti.

Tabella III. — Per lo studio del fenomeno di marea entro la Laguna di Venezia: oltre a Diga Sud del Porto di Lido, Punta della Salute (Venezia, bacino di S. Marco), Porto industriale di Marghera. (1)

Tabella IV. — Per lo studio del fenomeno di marea agli estremi limiti della laguna ed in relazione agli studi di bonifica: Conche (vecchie foci della Brenta in laguna di Chioggia), Pagliaga (confluenza del fiume Dese con il canale Osellino presso la foce in laguna), Brondolo (fiume Brenta, alla confluenza del canale di Valle, presso la foce).

Tabella V. — Questa tabella dà i valori massimi e minimi raggiunti dal livello del mare nel mese, con le relative escursioni.

Tabella VI. — La tabella dà la massima ampiezza di marea osservata nel mese, sia fra alta e bassa come fra bassa ed alta marea consecutive.

**Materiale in sospensione nelle acque lagunari.** — In questa tabella vengono raccolti i dati relativi al materiale in sospensione nelle acque lagunari all'interno dei Canali Porti di Lido e di Malamocco e precisamente in corrispondenza alle località S. Nicolò di Lido e Faro Rocchetta.

A S. Nicolò di Lido (Canale di S. Marco) i saggi vengono raccolti, sia in flusso che in riflusso, durante i periodi di tempo nei quali si ritiene che la velocità di corrente raggiunga i valori più elevati.

A Faro Rocchetta (Canale Rocchetta) i saggi vengono raccolti in prossimità dell'alta e della bassa marea.

La torbidità è espressa in *grammi per metro cubo* (gr./ m.³).

I dati suddetti, rilevati in un determinato istante ed in un singolo punto della laguna, possono dare soltanto una nozione molto approssimata sul trasporto del materiale di sospensione nelle acque lagunari; essi potranno inoltre fornire degli elementi di guida per le ricerche future.

**Salsedine delle acque lagunari.** — Nella tabella vengono raccolti i dati della salsedine delle acque lagunari, rilevati nella mezzaria del Canale di S. Marco tra S. Nicolò di Lido e l'isola di S. Andrea, in corrispondenza delle massime alte e delle minime basse maree di ciascun periodo sigiziale, limitato dai tre giorni che comprendono ogni lunazione. I dati suddetti vengono raccolti allo scopo di definire le variazioni a lungo periodo della salsedine in laguna.

La salsedine è espressa in Cl. ‰ (quantità di cloro in grammi per litro) *ed in salinità* S (quantità di sali in grammi per chilo di acqua).

### SEGNI CONVENZIONALI

», dato mancante; — (--), dato interpolato o calcolato in base ad osservazioni interpolate; — ?, dato incerto.

(1) Rendendosi necessari alcuni lavori alla stazione mareografica di Marghera, situata all'imboccatura del Canale Vittorio Emanuele III, a fianco dell'Emporio dei Sali e Tabacchi, a partire dal mese di Luglio 1928 sono stati utilizzati per lo spoglio e vengono pubblicati i dati mareografici dei diagrammi della seconda stazione pure di Marghera, situata alla Darsena W.

Le quote dei bulloni di riferimento della nuova stazione sono le seguenti:

Bullone interno m. 2,4707 s. l. m. m.
Bullone esterno m. 2,0687 s. l. m. m.

N.B. — I dati sottolineati si riferiscono ad osservazioni influenzate da ondulazioni secondarie di una certa entità.

# METEOROLOGIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Dei vari Osservatori costituenti la Rete Meteorologica del Magistrato alle Acque si pubblicano le osservazioni di alcuni soltanto, scelti in modo da dare un'idea sull'andamento dei principali fenomeni meteorologici della Regione che hanno interesse più o meno diretto con l'Idrologia. Gli stessi criteri hanno servito per la scelta delle stazioni termometriche.

Le osservazioni nella Rete del Magistrato alle Acque si eseguono alle ore 8, 14 e 19 T. M. E., in accordo con l'orario internazionale per le osservazioni sinottiche.

Tutti gli Osservatori sono muniti di strumenti registratori, e alle ore indicate si fanno le letture, tanto ad essi, come agli strumenti a lettura diretta, in modo da apportare in seguito le correzioni del caso.

*Gli strumenti registratori* da cui si fanno gli spogli sono:

*per la pressione:* il barometrografo Agolini;

*per la temperatura:* il termografo, e *per l'umidità:* l'igrografo, tutti e due della ditta Richard;

*per il vento:* l'anemografo Steffens - Marini, ovunque, tranne all'Osservatorio di Treviso e quello del Lido, ove lo spoglio è desunto da un anemografo ad 8 direzioni del Richard;

*per le precipitazioni:* pluviografo Palazzo, oppure tipo M dell'Ufficio Idrografico.

Negli Osservatori principali sono in funzione anche altri tipi di registratori, ai quali si ricorre per l'eventuale interpolazione dei dati, nel caso d'interruzione agli strumenti comuni.

Gli strumenti, tarati all'atto della distribuzione, vengono di quando in quando verificati e controllati.

**Per tutti gli elementi meteorologici, di cui si dà conto nella presente parte «Meteorologia», a differenza di quello che si fa nell'altra parte «Pluviometria», si adotta il giorno civile dalle 0 alle 24.**

Dei diagrammi del termografo, igrografo, barografo si fa lo spoglio, ossia la lettura delle ordinate, ogni due ore.

La media relativa viene calcolata con la formula:

$$m = \frac{1}{12}(l_0 : 2 + l_2 + l_4 + \ldots + l_{22} + l_{24} : 2)$$

Alla media così calcolata si apporta la *correzione* ricavata dal diagramma delle correzioni, ottenuto portando sulle ascisse le letture fatte sul registratore, e sulle ordinate le correzioni dedotte dai confronti con le osservazioni agli strumenti a lettura diretta. Tale metodo si è trovato più rapido e più opportuno di quello di applicare giorno per giorno la correzione ricavata, oppure alla media dell'elemento la media aritmetica delle correzioni.

Per il *vento* si fa lo spoglio ogni ora.

Nella relativa colonna *è segnata la direzione prevalente del vento,* ossia la direzione secondo la quale esso ha soffiato per un maggior numero di ore durante la giornata.

La *media giornaliera* della velocità del vento, espressa in km. ora, è calcolata secondo la formula:

$$m = \frac{1}{24}(l_1 + l_2 + \ldots + l_{23} + l_{24})$$

Per due Osservatori, Belluno, Vicenza e per quelli di II° ordine, non ancora forniti di anemografo, la direzione e forza del vento sono stabilite a stima dall'osservatore.

Per ogni Osservatorio viene pubblicato la massima e minima temperatura giornaliera.

La *nebulosità* è espressa in decimi di cielo coperto, ed è la media aritmetica delle tre osservazioni.

*Note meteorologiche del mese.* — Vengono suggerite dall'esame dei dati raccolti negli Osservatori meteorologici e nelle Stazioni pluviometriche del Compartimento, e delle carte isobariche che si pubblicano nel Bollettino giornaliero dell'Ufficio; queste carte vengono talvolta rettificate in base alle pubblicazioni degli Uffici Meteorologici italiani ed esteri.

I numeri romani preceduti o no dalla parola - tipo - si riferiscono alla classificazione del Fabris (1) alla quale sono state portate leggere modifiche specialmente nei riguardi dei tipi III, XV e XVII.

I valori medi dei vari elementi meteorologici sono stati desunti in generale dai lavori del Prof. F. Eredia pubblicati negli Annali dell'Ufficio Centrale di Meteorologia e Geodinamica di Roma e si riferiscono ad oltre un trentennio di osservazioni. Soltanto per il Venda i valori medi sono stati dedotti da un decennio di osservazioni.

### SEGNI CONVENZIONALI

● Pioggia. - ⁎ Neve. - △ Nevischio. - Gragnuola - ▲ Grandine. - ≡ Nebbia. - ;≡ Nebbia piovigginosa. - ═ Nebbia all'orizzonte. - V Brina. - ⌴ Gelo. - ∾ Gelicidio. - ⌓ Rugiada. - ⇠ Aghi di ghiaccio. - ∞ Caligine. - ⨪ Temporale. - T Temporale lontano. - < Lampi senza tuoni. - ≷ Lampi e tuoni. - ⌉ Vento forte. - ⌉ Vento fortissimo. - ∔ Uragano di neve. - ⊖ Alone solare. - ∈ Alone lunare. - ⊕ Corona solare. - ∉ Corona lunare. - ⌒ Arcobaleno.

—, calma, o nessuna precipitazione;
», non giunte le osservazioni; dato mancante o non calcolato;
?, dato incerto;
(•), dato desunto dallo strumento a lettura diretta, invece che dal registratore; se il segno è messo in testa ad una decade, vale per tutti i dati successivi di quella decade;
••, dato interpolato o calcolato in base ad osservazioni interpolate;

Le lettere a p n, che seguono alcuni segni (quei di nebbia, pioggia, neve, grandine, temporale, lampi, tuoni), indicano la parte del giorno (rispettivamente dalle ore 8 alle 12, dalle 12 alle 19 e dalle 19 alle 8), in cui il fenomeno si è verificato.
Se il segno di pioggia, neve, nebbia non è seguito da *nessuna lettera*, vuol dire che il fenomeno ha durato tutto il giorno.

**Avvertenze.** — I valori massimo e minimo dei singoli elementi per ogni decade sono indicati col carattere grassetto.

(1) La neve si distribuì in modo irregolare sul suolo a causa del vento da cui era accompagnata; si può ritenere tuttavia che in media l'altezza del manto nevoso sia stato di 20 cm.

# Note meteorologiche del mese di Febbraio

(Redatte dal Prof. Dott. G. Crestani)

1. La *media mensile della temperatura* è ovunque fortemente inferiore al valor medio, la differenza è più piccola nell'interno della zona montuosa (5°,2 a Trento, 4°,4 a Bolzano), è invece molto forte in pianura, come quella che raggiunge 8°,6 a Rovigo, 8°,0 a Padova; nelle altre località la differenza è compresa tra gli estremi riportati.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Venda | Rovigo | Vicenza | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Febbr. 1929 | -3,4 | -1,7 | -1,3 | -5,0 | -3,1 | -2,2 | -4,0 | -4,0 | -4,0 | -2,6 | -2,6 | -1,4 |
| Val. medio | 2,8 | 5,3 | 4,5 | 1,5 | 4,8 | 4,6 | 4,0 | 2,6 | 4,6 | 3,9 | 2,6 | 3,0 |

2. La temperatura, nel suo andamento generale, continua la discesa già iniziata alla fine del mese precedente, raggiungendo un primo minimo tra il 3 e il 4: al 3 a Belluno - 18°,3, a Padova - 16°,3; al 4 a S. Michele all'Adige; dopo s'è verificato un lieve aumento generale della temperatura, al quale segue una nuova discesa; durante questa, tra l'11 e il 16, furono raggiunte temperature che nella maggior parte sono le più basse del mese: all'11 a Trieste - 14°,3, al 12 al Venda - 17°,5, a Venezia - 12°,4 ecc., al 15 a Bolzano - 10°,6, a Padova il termometro torna a segnare - 16°,3 come al 3, a Rovigo - 20°,3 (*la temperatura più bassa raggiunta in pianura*). In seguito il termometro andò lentamente salendo, e alla fine del mese (dal 25 in poi) sono segnate sia le medie diurne come le massime assolute più alte: la massima assoluta il 27 al Venda fu 6°,7, a Venezia 9°,6, a Padova 6°,7.

L'escursione termometrica del mese è stata 24°,2 al Venda, 22°,0 a Venezia, 23°,0 a Padova.

Dalle stazioni termometriche disseminate nella regione montuosa risulta che in questi periodi di maggior freddo spesso il termometro a minima si è avvicinato ai 20 gradi sotto zero; talora anzi, alle quote superiori ai mille metri, si è mantenuto anche sotto a tale limite, segnando a Monteneve (m. 2332, Val Passiria) - 25°,0 al 2, - 27°,0 al 12, - 26°,0 al 13 e al 14, a Sesto (m. 1518, bacino Drava) - 28°,0 al 3, - 26°,0 al 12, alle Terme Brennero (m. 1809, bacino Isarco) - 25°,0 al 12, a Casere (m. 1600, bacino Isarco) - 25°,0 al 12, a Riva di Tures (m. 1600, bacino Isarco) - 25°,0 al 12, a Misurina (m. 1760, bacino Ansiei) - 27°,0 al 3, - 25°,0 all'11 e - 29°,0 al 12 (è questa *la temperatura più bassa segnata nella regione* in questa stagione); ad Idria (m. 1000, bacino Revnovse) - 25°,0 all'11 e al 12.

Le temperature minime segnate in pianura e in montagna in questi due periodi di freddo sono *le più basse che siano state registrate da decenni e decenni*.

3. In 20 giorni (dal 3 al 10, dal 15 al 19 e dal 21 al 27) la minima diurna della temperatura al Venda fu superiore che a Padova; si sono avute differenze tra minima Venda e minima Padova molto forti come ad esempio al 4 con 9°,0, al 5 con 15°,0 (la differenza più forte del mese, e tra le più forti misurate), 11°,2 al 6. Al 4 e al 5 tutto il giorno fu completamente sereno, invece al 6 al mattino al Venda fu 1/4 coperto; in tutti questi giorni il vento fu sempre debole e l'umidità relativamente molto bassa. Tra le differenze notevoli vanno ricordate anche quelle di 10°,0 al 9, e di 10°,1 al 16.

In tutto il mese la massima diurna al Venda fu inferiore di quella di Padova, ad indicarci dunque che l'inversione termica svelataci dal comportamento delle minime si è limitata alle sole ore più fredde della giornata.

La media mensile dell'escursione diurna della temperatura è stata di 10°,9 a Padova e di 4°,9 al Venda.

La media della prima e seconda decade è ovunque sotto zero, e, in qualche località anche in pianura, di più gradi; la media della terza decade invece è sopra zero nella maggior parte dei luoghi in pianura, cosicchè nella media generale della regione la temperatura zero in questa ultima decade trovasi tra i 400 e i 500 m. dal suolo. Salendo, in tutto il mese, la temperatura nella media diminuisce molto lentamente con la quota, almeno sino ai 2000 m., altezza a cui si ha un numero sufficiente di stazioni per potersi parlare di andamento medio.

5. Le precipitazioni caddero in forma di *neve* in tutta la regione nel primo periodo che va dall'11 al 14; nell'altro periodo dal 25 al 27 s'iniziarono in forma di neve, ma poi verso la fine del periodo in pianura caddero in forma di pioggia. Vanno aggiunte poche precipitazioni in forma di neve specie nella zona montuosa al 20. Le precipitazioni furono sempre e tutte poco abbondanti.

6. Il *manto nevoso*, il cui spessore al principio del mese era 178 cm. a Monteneve (m. 2332), tra i 60 e gli 80 cm. attorno ai 2000 m., attorno ai 50 cm. verso i 1000 m., diminuisce di qualche cm. nei primi giorni; l'intemperie del periodo dall'11 al 14 portano un rifornimento di pochi cm.; in seguito lo spessore torna a diminuire. Un po' maggiore è il rifornimento verso la fine del mese, così all'ultimo del mese lo spessore del manto è una diecina di cm. superiore a quello del principio.

6. La *nebulosità media* in questo mese è inferiore al valor medio in pianura, è superiore invece nell'interno della zona montuosa, per esempio lungo il bacino dell'Adige.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Vicenza | Venezia | Padova | Rovigo | Trento | S. Michele | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Febbr. 1929 | 5,6 | 4,4 | 4,2 | 3,3 | 4,4 | 4,4 | 4,5 | 5,1 | 5,0 | 4,5 | 4,0 | 4,0 |
| Val. medio | 4,9 | 5,3 | 5,1 | 5,5 | 5,5 | 4,7 | 5,9 | 5,3 | 6,0 | 4,3 | 3,6 | 3,5 |

7. La *carta delle precipitazioni* non si presta ad un riassunto d'insieme e ad un'interpretazione, come eravamo soliti nei mesi passati. Le precipitazioni furono scarse ovunque; in qualche zona nel basso Friuli mancarono del tutto (Fratta d'Oderzo, Portogruaro, ecc.); esse in gran parte della regione, in pianura come il alta montagna (Val Venosta e valli confluenti), furono al di sotto dei 10 mm. Invece le precipitazioni sono comprese tra 10 e 20 mm.: nell'Istria, in quasi tutta la zona Alpina e nel basso Polesine; nel Delta del Po sono tra 20 e 30 mm. Qualche valore sporadico oltre i 50 mm. segnalato qua e là non merita molto credito, perchè da tutti gli osservatori fu accusata la grande difficoltà della misura delle precipitazioni; la neve, portata da vento forte, si distribuì molto irregolarmente; si ammassò qua e mancò quasi del tutto poco più in là, anche a pochi metri di distanza.

8. La *quantità delle precipitazioni* cadute nelle singole località della regione, come abbiamo visto, furono piccole ovunque; molto al di sotto del valor normale, tutte allo stato di neve, in qualche zona esse anzi mancarono del tutto, come appare dal seguente specchietto.

| | Pisino | Trieste | Gorizia | Plezzo | Conegliano | Treviso | Venezia |
|---|---|---|---|---|---|---|---|
| Febbr. 1929 | 48,3 | 26,8 | 6,6 | 16,6 | 7,5 | 4,1 | 20,0 |
| Valore medio | 82,5 | 59,7 | 74,0 | 175,7 | 57,6 | 55,1 | 40,1 |
| Rapporto | 0,59 | 0,45 | 0,09 | 0,09 | 0,13 | 0,07 | 0,50 |

| | Padova | Rovigo | Vicenza | Recoaro | Trento | S. Michele | Bolzano | Silandro |
|---|---|---|---|---|---|---|---|---|
| Febbr. 1929 | 8,2 | 59,0 | 27,5 | 14,5 | 6,8 | 8,2 | 8,2 | 7,2 |
| Valore medio | 46,1 | 35,1 | 75,1 | 128,0 | 60,7 | 40,2 | 20,5 | 27,0 |
| Rapporto | 0,18 | 1,68 | 0,37 | 0,11 | 0,11 | 0,20 | 0,40 | 0,34 |

9. In alto e lungo il mare spirarono *venti* impetuosi; difatti al Venda la media diurna della velocità del vento in ben 15 giorni ha superato i 20 km/h e in 9 di questi i 30 km/h, raggiungendo i km/h 61,5 al giorno 13; a Venezia in 13 giorni tale media ha superato i 20, e in 8 di questi i 30, raggiungendo i 51,3 km/h all'11; a Trieste il limite 20 fu oltrepassato in 16 giorni: in 4 giorni anzi la media oltrepassò i 70 km/h raggiungendo i 76,1 il 18. I percorsi orari massimi sono stati km. 92 al Venda dalle 9h alle 10h del 14, e dalle 14h alle 15h del 28; km. 74 a Venezia dalle 20h alle 21h del 28; km. 115 a Trieste dalle 21h alle 22h; sempre vento tra ENE ed E.

Dall'esame della *rosa dei venti* a 16 direzioni, costruita con lo spoglio orario delle registrazioni dell'anemografo risulta:

A Fiume scarse sono le direzioni occidentali comprese nel settore da NW a S (17 % a 7 direzioni); le altre presentano tre massimi, uno a SE (7 %), un secondo a ENE (21 %) e un terzo a NNE (19 %).

A Trieste ha una fortissima prevalenza la direzione ENE (43 %), alle direzioni comprese nel settore che da NE per W va a SSE spetta 20 % a 12 direzioni.

A Venezia mancano quasi del tutto le direzioni meridionali da SW a ESE (1 % a 6 direzioni); sono poche quelle occidentali da NW a WSW (14 % a 4 direzioni), tra le rimanenti si presentano due massimi bene pronunciati, uno a ENE con 18 %, l'altro a NNW con 24 %.

Al Venda la rosa si raccoglie come al solito in due settori: uno orientale, il più sviluppato, da E a NE (60 % a 3 direzioni), l'altro appena accennato da NW ad W (19 % a 3 direzioni); tutte e due sono leggermente ruotati verso il Nord rispetto alla direzione solita.

A Padova sono scarsissime le direzioni comprese nel settore da WSW per S a ENE (10 % a 9); tra le rimanenti si hanno due massimi: uno a NNE (15 %), l'altro a WNW (18 %).

A Trento riappare la rosa tripartita attorno alle direzioni NNW (16 %), ENE (19 %) e SSE (6 %).

10. La *media mensile della pressione atmosferica* è alquanto inferiore al valor normale; l'altezza barometrica di questo mese a Venezia è stata di mm. 762,5, mentre il valor normale è mm. 764,3 dunque una differenza in difetto di mm. 1,8.

L'estremo più alto dell'altezza barometrica a Venezia è stato mm. 774,9 alle 2h del 20; l'estremo più basso è stato di mm. 746,7 alle 15h del 13; dunque un'escursione mensile di mm. 28,2, quasi uguale al valor medio dell'escursione mensile nella regione, dedotto da molti anni che è di mm. 28,0.

Tra le *salite* del barometro più notevoli sono da noverare: dai mm. 746,7 delle 14h del 13 ai mm. 774,6 delle 24h del 21: mm. 27,9 in 202 ore, pari a mm. 0,14 all'ora; ai mm. 752,0 delle 6h del 28 ai mm. 762,0 delle 2h dell'1 marzo: mm. 10 in 20 ore, pari a mm. 0,50 all'ora.

Tra le *discese* più notevoli sono a noverare: dai mm. 771,5 delle 12h dell'8 ai mm. 746,7 delle 14h del 13: mm. 24,8 in 122 ore, pari a mm. 0,20 all'ora; dai mm. 774,0 delle 10h del 22 ai mm. 764,4 delle 7h del 23, mm. 9,6 in 21 ore, pari a mm. 0,46 all'ora.

N.B. Le altezze barometriche qui riportate sono ridotte a 0° e al livello del mare.

11. L'unito specchietto mostra i *tipi isobarici* presentatisi al mattino alle ore 8 e le *condizioni di tempo* nei riguardi delle precipitazioni da cui essi furono accompagnati nel corso della giornata (da una mezzanotte all'altra).

| Tipi | I | IIIa | IV | X | XI | XIII | XV | XVIa | XVIb | XVIc | XVIII | * | Totale |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Con precipit. generali . . . | — | — | 2 | — | — | — | 1 | 1 | 3 | — | — | — | 7 |

| Senza precipitazioni . . . | 4 | 2 | — | 2 | 3 | 1 | 2 | — | — | 4 | 2 | 1 | 21 |
| Totali . . | 4 | 2 | 2 | 2 | 3 | 1 | 3 | 1 | 3 | 4 | 2 | 1 | 28 |

Per quasi tutto il mese sull'Europa centrale ha persistito un elevato anticiclone che più volte nel suo nucleo ha superato i 780 mm., favorito dal suolo coperto di neve e dal conseguente progressivo raffreddamento per irraggiamento. Il ciclone atlantico quindi nei suoi spostamenti verso levante più volte battè la via del Mediterraneo, ciò che nello specchietto precedente è rivelato dal numero relativamente forte di tipi XI, XV, XVI e XVIII (16 in tutto). La presenza di bassa pressione nel Mediterraneo contemporaneamente alle alte pressioni nel centro Europa provocò nelle nostre regioni venti molto violenti dai quadranti settentrionali i quali, per la loro provenienza stessa, erano molto freddi, nè nessun riscaldamento ebbero a subire lungo il loro percorso tutto coperto di neve. E i giorni più freddi nella nostra regione in generale coincisero coi giorni più ventosi; va eccettuata qualche località nell'interno della pianura in cui, come a Padova, la minima diurna continuò a scendere anche nei giorni dopo che si fu calmato alquanto il vento e ciò per le forti perdite di calore con suolo tutto coperto di neve.

In due giorni con depressione nel Mediterraneo occidentale mancarono le precipitazioni; si può notare ad ogni modo che in uno di questi (al 10) eravamo alla vigilia delle precipitazioni; queste furono segnate al giorno successivo 11, e nell'altro caso al 16; il ciclone si allontanò rapidamente verso SE attraverso alla Sicilia.

Le nevi caddero con basse pressioni nel 3° quadrante della regione (XV, XVIa e XVIb) e alte pressioni nel 1° quadrante (Polonia e Russia).

Al 22 del mese l'Alta pressione europea s'allontana verso levante, e avanza il ciclone atlantico; il nucleo di questo è ancora sull'Oceano ma la pressione sull'Europa è diminuita tanto che al 23 l'isobara 760 corre sulla Spagna lungo le coste orientali, attraversa la Francia si spinge sino in Polonia e per il Golfo di Riga, attraverso lo Iutland, raggiunge la Norvegia meridionale. E la pressione continua a diminuire, nei giorni successivi; al 26 e 27 si delinea una striscia di minor pressione dal Golfo di Guascogna a Malta con un secondario nel Mediterraneo (tipo IV). Naturalmente questa nuova situazione porta un mitigamento generale nella temperatura.

12. La *laguna* fu in gran parte gelata; il congelamento ebbe inizio ai primi del mese, e andò scomparendo verso la fine; erano mantenuti liberi solo i canali di grande navigazione e gran parte del Bacino di S. Marco.

In queste condizioni in generale la *marea* si scostò di poco da quella prevista con l'analisi armonica, denunciando scostamenti nel livello, ora in un senso ora in un altro; questi raramente superarono i 20 cm.; furono raggiunti i 35 cm. nella prima bassa marea del 13 e i cm. 30 nella seconda.

# PLUVIOMETRIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Le tabelle contengono le osservazioni giornaliere ed i totali mensili delle precipitazioni verificatesi a tutte le stazioni della rete del Magistrato, raggruppate per **bacini principali** (o gruppi di bacini principali)

e per **pianure**, limitate dai principali corsi d'acqua della regione e così denominate:

| | |
|---|---|
| **pianura orientale** | *a*) fra Isonzo e Tagliamento |
| | *b*) fra Tagliamento e Piave |
| **pianura occidentale** | *a*) fra Piave e Brenta |
| | *b*) fra Brenta e Adige |
| **pianura polesana** | fra Adige e Po |

In apposita colonna vengono dati inoltre i nomi dei bacini secondari a cui appartengono le stazioni pluviometriche.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni pluviografiche sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dallo strumento a lettura diretta invece che dal registratore.

Le precipitazioni vengono generalmente misurate al mattino, alle ore 9, e assegnate al giorno in cui venne eseguita l'osservazione; comprendono sia la pioggia che la neve fusa.

I dati giornalieri ricavati dai diagrammi pluviografici comprendono le quantità di pioggia registrate dalle ore 9 del giorno precedente alle ore 9 del giorno che si considera.

Per ogni stazione è indicato il numero dei giorni con precipitazioni uguali o superiori ad 1 millimetro.

*Manto nevoso.* — Nella tabella vengono raccolte le altezze giornaliere del manto nevoso in cm. per alcune stazioni; per ogni stazione è segnata in grassetto la massima altezza raggiunta dalla neve durante il mese.

Su quattro cartine allegate al bollettino sono indicate le altezze del manto nevoso per alcune stazioni nei giorni indicati nelle cartine stesse.

In corrispondenza alle stazioni il cui nome per ragioni di spazio è abbreviato sono segnate in nero le quote s. l. m., ed in rosso le altezze della neve osservate in quel giorno.

Le altezze del manto nevoso vengono misurate con un'asta metrica posta nelle immediate vicinanze del pluvionivometro; esse danno quindi l'altezza del manto nevoso soltanto per il punto di misura.

### SEGNI CONVENZIONALI

P, pluviometro a superficie ricevente di $^1/_{10}$ di m.²;
Pn, pluvionivometro id. id. id. id.
Pa, pluviometro a superficie ricevente di $^1/_{20}$ di m.²;
Pv, pluvionivometro id. id. id. id.
Pr, pluviografo;

—, nessuna precipitazione;
*, neve;
•, pioggia;
u, precipitazioni avvenute sotto forma di neve non misurata;

», non giunte le osservazioni; dato mancante;
?, dato incerto;
(·), dato desunto dallo strumento a lettura diretta invece che dal registratore.

**Avvertenze.** — I valori massimi giornalieri delle precipitazioni sono indicati col carattere grassetto.

# REGIME DEI CORSI D'ACQUA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

**Altezze idrometriche giornaliere.** — Vengono raccolte in questa tabella le osservazioni eseguite agli idrometri principali, in funzione lungo i corsi d'acqua più importanti della regione.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni provviste di idrometrografo sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dalla lettura all'idrometro invece che dal registratore.

Nella II parte (annua) del Bollettino vengono riportate le caratteristiche di tutti gli idrometri della rete del Magistrato.

I valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese.

Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere *ordinario* sono *sopra* lo zero idrometrico, quelle stampate in carattere *minuscolo* e distinte dal segno — posto al di sopra di ognuna di esse, sono *sotto* lo zero idrometrico.

**Deflussi giornalieri e mensili.** — Per le principali stazioni per misure di portata vengono in questa tabella raccolti i valori seguenti: altezze idrometriche giornaliere, portate in mc. al secondo giornaliere e mensili, deflussi giornalieri e mensili.

Per le stazioni con idrometro a lettura diretta si è assunto come valore della portata giornaliera quello che corrisponde all'altezza osservata il giorno stesso all'idrometro di stazione. Per le stazioni fornite di registratore, si è assunta come portata giornaliera, quella corrispondente alla media delle altezze registrate ogni sei ore e, nel caso di notevoli variazioni del livello, quella corrispondente alla media delle altezze orarie.

I valori delle portate desunti dalle relative curve, vengono corretti mediante la curva di Stout, determinata in base alle variazioni verificatesi nelle singole sezioni.

I valori più elevati del mese sono stampati in grassetto, quelli più bassi in corsivo e sottolineati.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato e per secondo, calcolato per le portate massima, minima e media del mese.

**Misure di portata.** — La tabella riporta l'elenco ed i risultati delle misure di portata eseguite nel mese a cura dell'Ufficio. Per ognuna di esse viene indicato il bacino imbrifero in kmq. ed il contributo per kmq. in litri al secondo.

**Materiale in sospensione nell'acqua dei fiumi.** — Viene determinato e pubblicato: per l'**Isonzo** a *Salcano*, per il **Tagliamento** a *Venzone* e *Latisana*, per il **Piave** a *Belluno* (Borgo Piave), per il **Brenta** a *Bassano* e *Codevigo*, per il **Frassine** a *Borgo Frassine*, per l'**Adige** a *Pescantina* e *Boara Pisani*.

### SEGNI CONVENZIONALI

I, idrometro;
Ir, idrometro registratore;
», non giunte le osservazioni; dato mancante;

?, dato incerto;
(*), dato desunto dalle letture all'idrometro invece che dal registratore;
(**), dato interpolato;

°, idrometro o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chiusura dei sostegni di navigazione, oppure dalle manovre degli impianti per derivazione d'acqua.

(1) Nei giorni dal 13 al 16 l'acqua era gelata nei pressi dell'idrometro.
(2) Il brusco abbassamento di livello nei giorni 3-10-17-24 è dovuto ad operazioni d'invaso nei serbatoi del gruppo Idroelettrico di S. Croce.
(3) L'acqua è totalmente derivata dal canale in riva destra.

(1) Dal 12 al 22 il corso d'acqua era gelato in corrispondenza dell'idrometro.
(2) Col gennaio 1929 lo zero idrometrico fu abbassato di 1 metro.

(*) Nella portata unitaria e integrale è anche considerata la portata del canale di derivazione per l'irrigazione dell'Alto Agro Veronese. Tale portata, variabile continuamente, in quanto è influenzata da numerose chiaviche di presa, non è possibile determinare giorno per giorno. Risulta però trattarsi di portate che non superano mai in autunno-inverno i m.³ 3 ed in primavera - estate i m.³ 16. Calcolando per l'inverno una portata media di 2 m.³ e per la primavera - estate di 15 m.³ veniamo a commettere nel calcolo della portata integrale dell'Adige un errore del tutto trascurabile, in relazione ai limiti di tolleranza che ci siamo proposti nelle misure di portata. Nei valori delle portate e dei deflussi è inoltre considerata la portata, derivata mediante sollevamento meccanico, del canale d'irrigazione di sinistra dell'Adige.

## Misure di portata eseguite nel mese

| N. d'ordine | Bacino principale | Corso d'acqua | Località | Giorno | Idrometro | Altezza idrometrica | Sezione liquida in mq. | Portata m. c. al secondo | Bacino imbrifero in kmq. | Contributo per kmq. in litri |

# GEOIDROLOGIA

Le osservazioni freatimetriche vengono effettuate dieci volte al mese nei giorni 2-5-8-11-14-17-20-23-26-29, al mattino, prima degli ordinari attingimenti d'acqua.

Le stazioni sono elencate in relazione alla progressiva distanza dall'asse dei corsi d'acqua e procedendo da monte a valle. I nomi stampati in grassetto indicano che la stazione è fornita di apparato registratore dei livelli freatici.

Le quote del pelo d'acqua nei pozzi sono tutte riferite al livello medio del mare. Per la pianura fra Tagliamento e Torre, per quelle del Brenta e dell'Adige le quote dei pozzi sono state desunte dalle tavolette al 25.000 dell'Istituto Geografico Militare e devono pertanto ritenersi approssimate; per gli altri pozzi le quote sono state determinate mediante livellazione geometrica.

### SEGNI CONVENZIONALI

°, idrometro a lettura diretta o registratore posto in località ov'è sentito l'influsso della marea o delle manovre degli impianti per derivazione d'acqua;
», non giunte le osservazioni, dato mancante;
?, dato incerto.

# MAREOGRAFIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Tutte le altezze di marea pubblicate nel bollettino sono espresse in centimetri e riferite ad una superficie ideale di base situata a m. 1.50 sotto il livello medio del mare, origine della rete altimetrica dello Stato, (si ottengono così nelle altezze di marea valori sempre positivi).

Le letture dirette delle altezze di marea, per il controllo del funzionamento degli apparati registratori, sono effettuate a partire da uno speciale bullone (caposaldo) quotato mediante collegamento di precisione coi caposaldi della rete altimetrica suddetta.

Le altezze di marea di Trieste invece sono riferite, dal Gennaio 1929 in poi, ad un piano ideale posto a 150 cm. sotto il livello medio determinato dal Prof. Hopfner sulla base dei dati orari del 1911. Tale livello medio si trova a cm. 252.9 sotto il caposaldo verticale dell'I. G. M., fissato alla parete interna NE della cabina mareografica.

Per riferire al suddetto piano ideale tutti i dati pubblicati nei bollettini dell'Ufficio Idrografico dal luglio 1926 a tutto dicembre 1928 si devono aumentare i dati stessi di 5 cm.

In tal modo possiamo dare le altezze di marea riferite al livello medio del mare, che abbiamo assunto come fondamentale in prima approssimazione, in attesa di stabilirlo definitivamente, in base a lunghe serie di osservazioni mareografiche.

I tempi sono calcolati sul tempo medio Etneo (T. M. E. C.).

Le stazioni mareografiche, delle quali si pubblicano i dati, sono state scelte:

TABELLE I e II. — Per lo studio del fenomeno di marea nell'Adriatico: Marano Lagunare, Porto Falconera, Diga Sud del Porto di Lido, San Felice di Chioggia (entro il Porto di Chioggia); Trieste, Ancona, Viesti.

TABELLA III. — Per lo studio del fenomeno di marea entro la Laguna di Venezia: oltre a Diga Sud del Porto di Lido, Punta della Salute (Venezia, bacino di S. Marco), Porto industriale di Marghera. (1)

TABELLA IV. — Per lo studio del fenomeno di marea agli estremi limiti della laguna ed in relazione agli studi di bonifica: Conche (vecchie foci della Brenta in laguna di Chioggia), Pagliaga (confluenza del fiume Dese con il canale Osellino presso la foce in laguna), Brondolo (fiume Brenta, alla confluenza del canale di Valle, presso la foce).

TABELLA V. — Questa tabella dà i valori massimi e minimi raggiunti dal livello del mare nel mese, con le relative escursioni.

TABELLA VI. — La tabella dà la massima ampiezza di marea osservata nel mese, sia fra alta e bassa come fra bassa ed alta marea consecutive.

**Materiale in sospensione nelle acque lagunari.** — In questa tabella vengono raccolti i dati relativi al materiale in sospensione nelle acque lagunari all'interno dei Canali Porti di Lido e di Malamocco e precisamente in corrispondenza alle località S. Nicolò di Lido e Faro Rocchetta.

A S. Nicolò di Lido (Canale di S. Marco) i saggi vengono raccolti, sia in flusso che in riflusso, durante i periodi di tempo nei quali si ritiene che la velocità di corrente raggiunga i valori più elevati.

A Faro Rocchetta (Canale Rocchetta) i saggi vengono raccolti in prossimità dell'alta e della bassa marea.

La torbidità è espressa in *grammi per metro cubo* (gr./ m.$^3$).

I dati suddetti, rilevati in un determinato istante ed in un singolo punto della laguna, possono dare soltanto una nozione molto approssimata sul trasporto del materiale di sospensione nelle acque lagunari; essi potranno inoltre fornire degli elementi di guida per le ricerche future.

**Salsedine delle acque lagunari.** — Nella tabella vengono raccolti i dati della salsedine delle acque lagunari, rilevati nella mezzaria del Canale di S. Marco tra S. Nicolò di Lido e l'isola di S. Andrea, in corrispondenza delle massime alte e delle minime basse maree di ciascun periodo sigiziale, limitato dai tre giorni che comprendono ogni lunazione. I dati suddetti vengono raccolti allo scopo di definire le variazioni a lungo periodo della salsedine in laguna.

La salsedine è espressa in Cl. ‰ (quantità di cloro in grammi per litro) *ed in salinità* S (quantità di sali in grammi per chilo di acqua).

### SEGNI CONVENZIONALI

», dato mancante; — (••), dato interpolato o calcolato in base ad osservazioni interpolate; — ?, dato incerto.

(1) Rendendosi necessari alcuni lavori alla stazione mareografica di Marghera, situata all'imboccatura del Canale Vittorio Emanuele III, a fianco dell'Emporio dei Sali e Tabacchi, a partire dal mese di Luglio 1928 sono stati utilizzati per lo spoglio e vengono pubblicati i dati mareografici dei diagrammi della seconda stazione pure di Marghera, situata alla Darsena W.

Le quote dei bulloni di riferimento della nuova stazione sono le seguenti:

Bullone interno m. 2,4707 s. l. m. m.
Bullone esterno m. 2,0687 s. l. m. m.

N.B. — I dati sottolineati si riferiscono ad osservazioni influenzate da ondulazioni secondarie di una certa entità.

(1) L'indicazione R indica *riflusso*, F indica *flusso*.
N. B. — Per la stazione di Faro Rocchetta le altezze di marea mancano per il congelamento dell' acqua entro il pozzetto mareografico. L'ora corrisponde a quella in cui la fase di marea era prevista.

**Salsedine delle acque lagunari**

# METEOROLOGIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Dei vari Osservatori costituenti la Rete Meteorologica del Magistrato alle Acque si pubblicano le osservazioni di alcuni soltanto, scelti in modo da dare un'idea sull'andamento dei principali fenomeni meteorologici della Regione che hanno interesse più o meno diretto con l'Idrologia. Gli stessi criteri hanno servito per la scelta delle stazioni termometriche.

Le osservazioni nella Rete del Magistrato alle Acque si eseguono alle ore 8, 14 e 19 T. M. E., in accordo con l'orario internazionale per le osservazioni sinottiche.

Tutti gli Osservatori sono muniti di strumenti registratori, e alle ore indicate si fanno le letture, tanto ad essi, come agli strumenti a lettura diretta, in modo da apportare in seguito le correzioni del caso.

*Gli strumenti registratori* da cui si fanno gli spogli sono:

*per la pressione:* il barometrografo Agolini;

*per la temperatura:* il termografo, e *per l'umidità:* l'igrografo, tutti e due della ditta Richard;

*per il vento:* l'anemografo Steffens - Marini, ovunque, tranne all'Osservatorio di Treviso e quello del Lido, ove lo spoglio è desunto da un anemografo ad 8 direzioni del Richard;

*per le precipitazioni:* pluviografo Palazzo, oppure tipo M dell'Ufficio Idrografico.

Negli Osservatori principali sono in funzione anche altri tipi di registratori, ai quali si ricorre per l'eventuale interpolazione dei dati, nel caso d'interruzione agli strumenti comuni.

Gli strumenti, tarati all'atto della distribuzione, vengono di quando in quando verificati e controllati.

**Per tutti gli elementi meteorologici, di cui si dà conto nella presente parte «Meteorologia», a differenza di quello che si fa nell'altra parte «Pluviometria», si adotta il giorno civile dalle 0 alle 24.**

Dei diagrammi del termografo, igrografo, barografo si fa lo spoglio, ossia la lettura delle ordinate, ogni due ore.

La media relativa viene calcolata con la formula:

$$m = \frac{1}{12}(l_0 : 2 + l_2 + l_4 + \ldots + l_{22} + l_{24} : 2)$$

Alla media così calcolata si apporta la *correzione* ricavata dal diagramma delle correzioni, ottenuto portando sulle ascisse le letture fatte sul registratore, e sulle ordinate le correzioni dedotte dai confronti con le osservazioni agli strumenti a lettura diretta. Tale metodo si è trovato più rapido e più opportuno di quello di applicare giorno per giorno la correzione ricavata, oppure alla media dell'elemento la media aritmetica delle correzioni.

Per il *vento* si fa lo spoglio ogni ora.

Nella relativa colonna *è segnata la direzione prevalente del vento,* ossia la direzione secondo la quale esso ha soffiato per un maggior numero di ore durante la giornata.

La *media giornaliera* della velocità del vento, espressa in km. ora, è calcolata secondo la formula:

$$m = \frac{1}{24}(l_1 + l_2 + \ldots + l_{23} + l_{24})$$

Per due Osservatori, Belluno, Vicenza e per quelli di II° ordine, non ancora forniti di anemografo, la direzione e forza del vento sono stabilite a stima dall'osservatore.

Per ogni Osservatorio viene pubblicato la massima e minima temperatura giornaliera.

La *nebulosità* è espressa in decimi di cielo coperto, ed è la media aritmetica delle tre osservazioni.

*Note meteorologiche del mese.* — Vengono suggerite dall'esame dei dati raccolti negli Osservatori meteorologici e nelle Stazioni pluviometriche del Compartimento, e delle carte isobariche che si pubblicano nel Bollettino giornaliero dell'Ufficio; queste carte vengono talvolta rettificate in base alle pubblicazioni degli Uffici Meteorologici italiani ed esteri.

I numeri romani preceduti o no dalla parola - tipo - si riferiscono alla classificazione del Fabris [1] alla quale sono state portate leggere modifiche specialmente nei riguardi dei tipi III, XV e XVII.

I valori medi dei vari elementi meteorologici sono stati desunti in generale dai lavori del Prof. F. Eredia pubblicati negli Annali dell'Ufficio Centrale di Meteorologia e Geodinamica di Roma e si riferiscono ad oltre un trentennio di osservazioni. Soltanto per il Venda i valori medi sono stati dedotti da un decennio di osservazioni.

### SEGNI CONVENZIONALI

● Pioggia. - ⁎ Neve. - △ Nevischio. - Gragnuola - ▲ Grandine. - ≡ Nebbia. - ⁝≡ Nebbia pioviggionosa. - ≡ Nebbia all'orizzonte. - V Brina. - ⌴ Gelo. - ∾ Gelicidio. - ⌓ Rugiada. - ·-- Aghi di ghiaccio. - ∞ Caligine. - K Temporale. - T Temporale lontano. - < Lampi senza tuoni. - ⪢ Lampi e tuoni. - ⱶ Vento forte. - ⱶ Vento fortissimo. - ∔ Uragano di neve. - ⊖ Alone solare. - ∈ Alone lunare. - ⊕ Corona solare. - ∉ Corona lunare. - ⌒ Arcobaleno.

—, calma, o nessuna precipitazione;

», non giunte le osservazioni; dato mancante o non calcolato;

?, dato incerto;

(·), dato desunto dallo strumento a lettura diretta, invece che dal registratore; se il segno è messo in testa ad una decade, vale per tutti i dati successivi di quella decade;

••, dato interpolato o calcolato in base ad osservazioni interpolate;

Le lettere a p n, che seguono alcuni segni (quei di nebbia, pioggia, neve, grandine, temporale, lampi, tuoni), indicano la parte del giorno (rispettivamente dalle ore 8 alle 12, dalle 12 alle 19 e dalle 19 alle 8), in cui il fenomeno si è verificato.

Se il segno di pioggia, neve, nebbia non è seguito da *nessuna lettera*, vuol dire che il fenomeno ha durato tutto il giorno.

**Avvertenze.** — I valori massimo e minimo dei singoli elementi per ogni decade sono indicati col carattere grassetto.

# Note meteorologiche del mese di Marzo

(Redatte dal Prof. Dott. G. Crestani)

1. La *media mensile della temperatura* in tutta la regione, esclusa la vallata dell'Adige, è alquanto inferiore al valor medio dedotto da molti anni; la differenza importa 1°,5 a Trieste, altrove è più piccola; a Trento il valor medio è superato di 0°,3, a Bolzano di 1°,9.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Venda | Rovigo | Vicenza | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Marzo 1929 | 5,2 | 7,0 | 7,6 | 5,2 | 7,2 | 6,7 | 6,9 | 5,4 | 7,4 | 7,1 | 7,5 | 9,4 |
| Val. medio | 5,8 | 8,5 | 7,8 | 5,8 | 8,4 | 7,9 | 7,7 | 5,9 | 8,6 | 7,7 | 7,2 | 7,5 |

2. La temperatura nel suo andamento generale a grandi linee è rapidamente crescente; le medie della terza decade sono maggiori di quelle della seconda, e queste di quelle della prima.

Dall'esame più particolareggiato dell'andamento di giorno in giorno si riscontra che nei primi giorni del mese la temperatura è in diminuzione e al 3 e 4 tocca il minimo del mese: difatti al 3 la minima al Venda è -8°,4, a Venezia -4°,1, al 4 a Padova è -5°,0, ecc. In seguito la temperatura cresce; la salita è interrotta verso la fine della seconda decade, in cui ovunque è segnato un altro minimo, questa volta secondario; successivamente riprende a crescere abbastanza rapidamente, tanto che alla fine del mese son raggiunte le temperature più elevate; difatti al 27 a Venezia si hanno 18°,4, al 30 a Padova 22°,6, al Venda 18°,0 ecc.

L'escursione termometrica mensile pertanto è stata al Venda 26°,4, a Venezia 22°,5, a Padova 27°,6.

3. In 20 giorni (dal 6 al 9, dall'11 al 15, dal 18 al 22, dal 24 al 26 e dal 29 al 31) la minima diurna della temperatura al Venda fu superiore che a Padova; si sono avute differenze Venda-Padova molto forti: 5°,6 al 15, 8°,0 al 19, 7°,0 al 20, 6°,8 al 21. Sempre in tutto il mese la massima diurna al Venda fu inferiore che a Padova ad indicarci che le inversioni termiche svelateci dal comportamento delle minime si limitavano alle sole ore più fredde della giornata.

La media della prima decade dell'escursione diurna della temperatura fu 5°,1 al Venda, e 9°,8 a Padova, la media della seconda decade 6°,1 al Venda, 13°,7 a Padova, quella della terza 6°,3 al Venda, 13°,5 a Padova.

L'altezza dell'isoterma 0° nelle singole decadi (calcolata dalla temperatura media decadica del Venda e assumendo come decremento della temperatura lungo la verticale quello calcolato per l'aria libera in Val Padana) risulta nella prima decade alquanto al di sotto dei 600 m. (Venda temp. -0°,6), verso i 1500 m. nella seconda e verso i 2000 m. nella terza.

Invece dalla distribuzione verticale della temperatura, calcolata dalle letture termometriche eseguite agli osservatori e alle stazioni, l'isoterma 0° nella prima decade è verso i 600 m., nella seconda è verso i 2200 m.; nella terza è di poco superiore a tale quota.

4. In gran parte delle stazioni di osservazione mancò addirittura qualsiasi registrazione di precipitazioni, caddero in poca quantità qua e là specie nella regione montuosa tra il 22-25 e solo nell'Istria il 28.

5. Il *manto nevoso* che nel mese precedente avea subito poche variazioni di spessore, in questo mese diminuisce rapidamente e tra il 15 e il 20 scompare in tutte le località al di sotto dei 2000 metri, all'ultimo del mese verso i 2000 ha uno spessore che va dai 25 cm. (Passo Tonale) ai 65 cm. (Passo Pordoi), lo spessore è maggiore a quote superiori (ai 2332 m. a Monteneve cm. 95).

6. La *nebulosità media* di questo mese, ovunque, escluso solo Pisino, è inferiore al valor medio dedotto da molti anni. Tale differenza è elevata come quella che in più luoghi come a Trieste, Belluno, Venezia, Padova, Rovigo, Treviso, Bolzano è superiore ai due decimi di cielo coperto.

| | Pisino | Trieste | Gorizia | Belluno | Vicenza | Venezia | Padova | Rovigo | Treviso | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Marzo 1929 | 5,7 | 3,0 | 4,6 | 2,4 | 2,4 | 3,5 | 3,5 | 2,8 | 3,0 | 3,0 | 2,3 |
| Val. medio | 5,2 | 5,7 | 5,2 | 6,2 | 5,0 | 6,2 | 5,6 | 6,0 | 5,9 | 5,2 | 4,4 |

7. La *quantità delle precipitazioni* fu scarsissima ovunque: in molti luoghi esse mancarono del tutto, nei rimanenti il rapporto più elevato tra quantità caduta e valor medio supera di poco 0,2.

| | Fiume | Pisino | Pola | Trieste | Gorizia | Plezzo | Belluno | Conegliano | Treviso | Venezia |
|---|---|---|---|---|---|---|---|---|---|---|
| Marzo 1929 | 0,0 | 3,4 | 3,0 | 1,4 | 3,2 | 3,3 | 0,4 | 0,0 | 0,0 | 0,0 |
| Valore medio | 126,7 | 92,8 | 67,0 | 72,5 | 110,0 | 223,0 | 96,2 | 86,3 | 87,2 | 54,8 |

| Rapporto | 0,08 | 0,00 | 0,00 | 0,02 | 0,00 | 0,01 | 0,21 | 0,03 |

8. La *carta delle precipitazioni* mostra come in tutta la pianura sino al Tagliamento siano mancate completamente le precipitazioni; fa eccezione un'area ristretta dal lato NE dei Colli Berici ed Euganei. Nel rimanente della regione le aree prive di precipitazioni sono ristrettissime, disseminate qua e là; ancora meno numerose e più ristrette sono le aree con precipitazioni sopra i 10 mm. Di queste una sottilissima, che comincia poco ad E di Passo Resia, comprende Monteneve e il Brennero con un massimo di mm. 25 a Casere di Sotto, un'altra sulle Alpi Giulie comprende Ampezzo, Tolmezzo, Timau, massimo mm. 14 ad Avosacco, e una terza attorno al Monte Nevoso, con massimo mm. 28 al Rifugio G. D'Annunzio (totale massimo del mese nella regione tutta).

9. Al 1° del mese raggiunge il massimo della sua violenza la *bora*; infatti a Trieste la media diurna fu di km. 96,3 con un massimo percorso orario dalla mezzanotte alle ore 1 di 117 km.; al giorno seguente la violenza scese alquanto (media 68,6, massimo 88,0) e al 3 la media è 26,8; al 4 la media scende finalmente sotto i 20 km. Questo limite di 20 km. è superato in altri 3 giorni, al 16, al 17 e al 28, che coi tre precedenti formano sei giorni in tutto il mese.

A Venezia tale limite di 20 km. fu superato in 4 giorni all'1 e al 2 e al 16 e 17; al Venda in 8 giorni dall'1 al 3, al 9, al 16 e 17 e al 28 e 29.

In tutti questi giorni sempre prevalsero venti dal primo quadrante, tranne il 9 al Venda, in cui spirano di prevalenza venti occidentali.

Anche a Venezia la bora fu violenta; 69,1 km./h fu la media dell'1, e 51,5 quella del 2; meno violenta al Venda dove le medie in quei giorni furono rispettivamente 41,5 e 40,5.

Dall'esame della *rosa dei venti* a 16 direzioni costruita con lo spoglio orario delle registrazioni dell'anemografo risulta:

A Fiume furono scarse le direzioni meridionali comprese nel settore da ESE a WSW (19 % a 7 direzioni), le altre direzioni si raccolgono attorno a 3 massimi ENE (7 %), N (15 %) e WNW (13 %).

A Trieste scarse si presentarono le direzioni comprese nel settore da SSE ad W (7 % a 6 direzioni), le altre direzioni si raccolgono nei due settori uno da NW a N (17 % a 3 direzioni) e il secondo da ENE a SE (54 % a 4 direzioni).

A Venezia la rosa si scosta notevolmente dalla forma solita; scarse le direzioni occidentali, le altre direzioni si raccolgono attorno a tre massimi bene pronunciati N (14 %), NE (16 %) e S (10 %).

Al Venda la rosa ha la forma solita: le direzioni sono raccolte attorno a due settori, uno occidentale col massimo ad W (10 %), l'altro orientale col massimo ENE (20 %).

A Padova furono scarse le direzioni meridionali comprese nel settore da ESE a WNW (21 % a 7 direzioni), delle altre hanno la maggior prevalenza quelle del primo quadrante con un massimo a N (14 %), mentre quelle occidentali hanno un massimo ad W (7 %).

A Trento la rosa ha la solita forma invernale, un settore nel primo quadrante con massimo a ENE (16 %), un altro nel quarto con massimo a NNW (17 %), il terzo lobo della rosa, il meridionale, è piccolissimo, difatti al suo massimo spetta 4 %.

10. La *media mensile della pressione atmosferica* è notevolmente superiore al valor normale, l'altezza barometrica di questo mese a Venezia è stata mm. 766,2, mentre il suo valor normale è mm. 760,2, dunque una differenza in eccesso di mm. 6,0

L'estremo più alto dell'altezza barometrica è stato di mm. 773,7 alle 12h del 2 marzo e l'estremo più basso è stato di mm. 753,3 alle 24h del 31; dunque un'escursione di mm. 20,4 alquanto inferiore al suo valor medio nella regione che s'aggira attorno ai mm. 25.

Le variazioni barometriche nel mese furono piccole e lente; anzi dal 17 al 27 del mese l'altezza si è mantenuta tra i 767 e 772 mm.

Tra le *salite* del barometro più notevoli sono da noverarsi: dai mm. 758,7 delle 18h del 5 ai mm. 771,8 delle 12h del 5, mm. 13,1 in 66 ore, pari a mm. 0,20 all'ora, e dai mm. 763,7 delle 12h del 28 ai mm. 768,6 delle 22h del 28, mm. 49 in 10 ore, pari a mm. 0,49 all'ora.

Tra le *discese* notevoli sono da noverarsi: dai mm. 772,3 delle 12h del 3 ai mm. 758,8 delle 7h del 5, mm. 13,5 in 43 ore, pari a mm. 0,31 all'ora, e quella dai mm. 761,5 delle 9h del 31 ai mm. 753,3 delle 24h del 31, mm. 8,2 in 15 ore, pari a mm. 0,55 all'ora.

N.B. Le altezze barometriche sono ridotte a 0° e al livello del mare.

11. L'unito specchietto mostra i *tipi isobarici presentatisi* al mattino alle ore 8 e le *condizioni del tempo* nei riguardi delle precipitazioni da cui essi furono accompagnati nel corso della giornata (da una mezzanotte all'altra).

| Tipi | III | IIIa | IX | X | XI | XII | XIV | XVIb | XVIc | XVIII | * | Totale |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Con precipit. generali . . . . | — | — | — | — | — | — | — | — | — | — | — | — |
| Con precipit. parziali . . . | — | 1 | — | 1 | — | — | — | — | — | — | 2 | 4 |
| Senza precipitazioni . . . . | 1 | — | 4 | 7 | 1 | 5 | 2 | 1 | 1 | 3 | 2 | 27 |
| Totali . . | 1 | 1 | 4 | 8 | 1 | 5 | 2 | 1 | 1 | 3 | 4 | 31 |

A prima vista, dall'esame di questo specchio, appare subito il forte numero di configurazioni in cui (IX, X, XI, XII) predominarono alte pressioni sull'Europa centrale. Difatti dei cicloni approdanti dall'Atlantico parte proseguivano la loro marcia verso levante attraverso l'Europa settentrionale e le regioni polari, parte lungo la parte meridionale del Bacino mediterraneo. L'Europa centrale fu sempre sede di anticicloni, nel cui centro furono raggiunti valori della pressione elevati (anche superiori ai mm. 780). Talvolta l'anticiclone europeo, scese più a mezzogiorno, come il 21 (tipo III) e il 22 (tipo IIIa) e allora si presentò gradiente da SE sulle nostre regioni. Al 23 approda un nuovo anticiclone al Golfo di Guascogna, mentre l'anticiclone orientale è sul Mar Nero; sulla nostra regione si ha una sella e poco diversa è la configurazione del giorno successivo 24; tutte e due queste configurazioni non trovano posto nella classificazione adottata; ma ad ogni modo esse sono tali da continuare il breve periodo con qualche precipitazione non generale e leggerissima iniziatosi al 21; qualche precipitazione si ha pure al 25 come residuo del periodo, malgrado, che si sia elevata considerevolmente la pressione a Nord delle Alpi, per l'avvicinarsi dei due anticicloni creando un forte gradiente da Nord sulla penisola (tipo X).

Tra le configurazioni e relative trasformazioni più notevoli vanno ricordate quella svoltasi tra la fine del mese precedente e il principio del presente, che ha portato l'eccezionale bora dell'1. La vasta area ciclonica del 26 febbraio con vari nuclei stendentesi dal Golfo di Guascogna alla Cirenaica avanza verso SE, incalzata dall'anticiclone atlantico, questo già alla sera del 27 ha occupato tutta la Francia, il ciclone s'indugia sul Tirreno al 28 e all'1. Nel giorno della gran bora all'1 (§ 9) il nucleo anticiclonico che al 28 era sul Mar del Nord, è sulla Danimarca a mm. 784. L'isobara mm. 770 corre lungo le Alpi, l'isobara 750 mm. racchiudente il nucleo ciclonico del basso Tirreno corre da Cagliari all'isola Maddalena, quindi si ha una differenza di pressione al suolo di 20 mm. su una distanza di poco superiore ai 600 km. (quale è la distanza da Maddalena alle Alpi orientali).

Al 2 il ciclone Tirrenico si è allontanato verso S e quindi il gradiente barometrico si è notevolmente attenuato.

12. Eccezion fatta i primi due giorni del mese (in cui come abbiamo visto spirò la bora molto forte e la *marea* reale in Laguna fu più alta della marea prevista a mezzo dell'analisi armonica) in tutto il resto del mese la marea reale fu più bassa della prevista.

La differenza si fa abbastanza forte a partire dal 12 perchè in generale fu compresa tra i 20 e i 30 cm., quest'ultimo limite di 30 cm. fu superato più volte nella seconda bassa marea nei giorni dal 23 al 24 toccando i 40 cm. il 25 e 26.

# PLUVIOMETRIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Le tabelle contengono le osservazioni giornaliere ed i totali mensili delle precipitazioni verificatesi a tutte le stazioni della rete del Magistrato, raggruppate per **bacini principali** (o gruppi di bacini principali)

e per **pianure**, limitate dai principali corsi d'acqua della regione e così denominate:

| | |
|---|---|
| **pianura orientale** | *a*) fra Isonzo e Tagliamento<br>*b*) fra Tagliamento e Piave |
| **pianura occidentale** | *a*) fra Piave e Brenta<br>*b*) fra Brenta e Adige |
| **pianura polesana** | fra Adige e Po |

In apposita colonna vengono dati inoltre i nomi dei bacini secondari a cui appartengono le stazioni pluviometriche.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni pluviografiche sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dallo strumento a lettura diretta invece che dal registratore.

Le precipitazioni vengono generalmente misurate al mattino, alle ore 9, e assegnate al giorno in cui venne eseguita l'osservazione; comprendono sia la pioggia che la neve fusa.

I dati giornalieri ricavati dai diagrammi pluviografici comprendono le quantità di pioggia registrate dalle ore 9 del giorno precedente alle ore 9 del giorno che si considera.

Per ogni stazione è indicato il numero dei giorni con precipitazioni uguali o superiori ad 1 millimetro.

*Manto nevoso.* — Nella tabella vengono raccolte le altezze giornaliere del manto nevoso in cm. per alcune stazioni; per ogni stazione è segnata in grassetto la massima altezza raggiunta dalla neve durante il mese.

Su quattro cartine allegate al bollettino sono indicate le altezze del manto nevoso per alcune stazioni nei giorni indicati nelle cartine stesse.

In corrispondenza alle stazioni il cui nome per ragioni di spazio è abbreviato sono segnate in nero le quote s. l. m., ed in rosso le altezze della neve osservate in quel giorno.

Le altezze del manto nevoso vengono misurate con un'asta metrica posta nelle immediate vicinanze del pluvionivometro; esse danno quindi l'altezza del manto nevoso soltanto per il punto di misura.

### SEGNI CONVENZIONALI

P, pluviometro a superficie ricevente di $^1/_{10}$ di m.$^2$;
Pn, pluvionivometro id. id. id. id.
Pa, pluviometro a superficie ricevente di $^1/_{20}$ di m.$^2$;
Pv, pluvionivometro id. id. id. id.
Pr, pluviografo;

—, nessuna precipitazione;
*, neve;
•, pioggia;
n, precipitazioni avvenute sotto forma di neve non misurata;

», non giunte le osservazioni; dato mancante;
?, dato incerto;
(•), dato desunto dallo strumento a lettura diretta invece che dal registratore.

**Avvertenze.** — I valori massimi giornalieri delle precipitazioni sono indicati col carattere grassetto.

# REGIME DEI CORSI D'ACQUA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

**Altezze idrometriche giornaliere.** — Vengono raccolte in questa tabella le osservazioni eseguite agli idrometri principali, in funzione lungo i corsi d'acqua più importanti della regione.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni provviste di idrometrografo sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dalla lettura all'idrometro invece che dal registratore.

Nella II parte (annua) del Bollettino vengono riportate le caratteristiche di tutti gli idrometri della rete del Magistrato.

I valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese.

Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere *ordinario* sono *sopra* lo zero idrometrico, quelle stampate in carattere *minuscolo* e distinte dal segno — posto al di sopra di ognuna di esse, sono *sotto* lo zero idrometrico.

**Deflussi giornalieri e mensili.** — Per le principali stazioni per misure di portata vengono in questa tabella raccolti i valori seguenti: altezze idrometriche giornaliere, portate in mc. al secondo giornaliere e mensili, deflussi giornalieri e mensili.

Per le stazioni con idrometro a lettura diretta si è assunto come valore della portata giornaliera quello che corrisponde all'altezza osservata il giorno stesso all'idrometro di stazione. Per le stazioni fornite di registratore, si è assunta come portata giornaliera, quella corrispondente alla media delle altezze registrate ogni sei ore e, nel caso di notevoli variazioni del livello, quella corrispondente alla media delle altezze orarie.

I valori delle portate desunti dalle relative curve, vengono corretti mediante la curva di Stout, determinata in base alle variazioni verificatesi nelle singole sezioni.

I valori più elevati del mese sono stampati in grassetto, quelli più bassi in corsivo e sottolineati.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato e per secondo, calcolato per le portate massima, minima e media del mese.

**Misure di portata.** — La tabella riporta l'elenco ed i risultati delle misure di portata eseguite nel mese a cura dell'Ufficio. Per ognuna di esse viene indicato il bacino imbrifero in kmq. ed il contributo per kmq. in litri al secondo.

**Materiale in sospensione nell'acqua dei fiumi.** — Viene determinato e pubblicato: per l'Isonzo a *Salcano*, per il **Tagliamento** a *Venzone* e *Latisana*, per il **Piave** a *Belluno* (Borgo Piave), per il **Brenta** a *Bassano* e *Codevigo*, per il **Frassine** a *Borgo Frassine*, per l'**Adige** a *Pescantina* e *Boara Pisani*.

### SEGNI CONVENZIONALI

I, idrometro;
Ir, idrometro registratore;
», non giunte le osservazioni; dato mancante;

?, dato incerto;
(*), dato desunto dalle letture all'idrometro invece che dal registratore;
(**), dato interpolato;

°, idrometro o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chiusura dei sostegni di navigazione, oppure dalle manovre degli impianti per derivazione d'acqua.

(1) Il brusco abbassamento di livello verificatosi nei giorni 3-10-17-19-23-31 è dovuto ad operazioni d'invaso nei serbatoi del gruppo Idroelettrico di S. Croce.
(2) Nei giorni in cui compare la lineetta l'acqua è totalmente derivata dal canale in riva destra.

(*) Nella portata unitaria e integrale è anche considerata la portata del canale di derivazione per l'irrigazione dell'Alto Agro Veronese. Tale portata, variabile continuamente, in quanto è influenzata da numerose chiaviche di presa, non è possibile determinare giorno per giorno. Risulta però trattarsi di portate che non superano mai in autunno-inverno i m.³ 3 ed in primavera - estate i m.³ 16. Calcolando per l'inverno una portata media di 2 m.³ e per la primavera - estate di 15 m.³ veniamo a commettere nel calcolo della portata integrale dell'Adige un errore del tutto trascurabile, in relazione ai limiti di tolleranza che ci siamo proposti nelle misure di portata. Nei valori delle portate e dei deflussi è inoltre considerata la portata, derivata mediante sollevamento meccanico, del canale d'irrigazione di sinistra dell'Adige.

## Misure di portata eseguite nel mese

# GEOIDROLOGIA

Le osservazioni freatimetriche vengono effettuate dieci volte al mese nei giorni 2-5-8-11-14-17-20-23-26-29, al mattino, prima degli ordinari attingimenti d'acqua.

Le stazioni sono elencate in relazione alla progressiva distanza dall'asse dei corsi d'acqua e procedendo da monte a valle. I nomi stampati in grassetto indicano che la stazione è fornita di apparato registratore dei livelli freatici.

Le quote del pelo d'acqua nei pozzi sono tutte riferite al livello medio del mare. Per la pianura fra Tagliamento e Torre, per quelle del Brenta e dell'Adige le quote dei pozzi sono state desunte dalle tavolette al 25.000 dell'Istituto Geografico Militare e devono pertanto ritenersi approssimate; per gli altri pozzi le quote sono state determinate mediante livellazione geometrica.

**SEGNI CONVENZIONALI**

°, idrometro a lettura diretta o registratore posto in località ov'è sentito l'influsso della marea o delle manovre degli impianti per derivazione d'acqua;
», non giunte le osservazioni, dato mancante;
?, dato incerto.

## Osservazioni freatimetriche e variazioni freatiche in relazione alle condizioni idrometriche

# MAREOGRAFIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Tutte le altezze di marea pubblicate nel bollettino sono espresse in centimetri e riferite ad una superficie ideale di base situata a m. 1.50 sotto il livello medio del mare, origine della rete altimetrica dello Stato, (si ottengono così nelle altezze di marea valori sempre positivi).

Le letture dirette delle altezze di marea, per il controllo del funzionamento degli apparati registratori, sono effettuate a partire da uno speciale bullone (caposaldo) quotato mediante collegamento di precisione coi caposaldi della rete altimetrica suddetta.

Le altezze di marea di Trieste invece sono riferite, dal Gennaio 1929 in poi, ad un piano ideale posto a 150 cm. sotto il livello medio determinato dal Prof. Hopfner sulla base dei dati orari del 1911. Tale livello medio si trova a cm. 252.9 sotto il caposaldo verticale dell' I. G. M., fissato alla parete interna NE della cabina mareografica.

Per riferire al suddetto piano ideale tutti i dati pubblicati nei bollettini dell' Ufficio Idrografico dal luglio 1926 a tutto dicembre 1928 si devono aumentare i dati stessi di 5 cm.

In tal modo possiamo dare le altezze di marea riferite al livello medio del mare, che abbiamo assunto come fondamentale in prima approssimazione, in attesa di stabilirlo definitivamente, in base a lunghe serie di osservazioni mareografiche.

I tempi sono calcolati sul tempo medio Etneo (T. M. E. C.).

Le stazioni mareografiche, delle quali si pubblicano i dati, sono state scelte:

Tabelle I e II. — Per lo studio del fenomeno di marea nell'Adriatico: Marano Lagunare, Porto Falconera, Diga Sud del Porto di Lido, San Felice di Chioggia (entro il Porto di Chioggia); Trieste, Ancona, Viesti.

Tabella III. — Per lo studio del fenomeno di marea entro la Laguna di Venezia: oltre a Diga Sud del Porto di Lido, Punta della Salute (Venezia, bacino di S. Marco), Porto industriale di Marghera. (1)

Tabella IV. — Per lo studio del fenomeno di marea agli estremi limiti della laguna ed in relazione agli studi di bonifica: Conche (vecchie foci della Brenta in laguna di Chioggia), Pagliaga (confluenza del fiume Dese con il canale Osellino presso la foce in laguna), Brondolo (fiume Brenta, alla confluenza del canale di Valle, presso la foce).

Tabella V. — Questa tabella dà i valori massimi e minimi raggiunti dal livello del mare nel mese, con le relative escursioni.

Tabella VI. — La tabella dà la massima ampiezza di marea osservata nel mese, sia fra alta e bassa come fra bassa ed alta marea consecutive.

**Materiale in sospensione nelle acque lagunari.** — In questa tabella vengono raccolti i dati relativi al materiale in sospensione nelle acque lagunari all'interno dei Canali Porti di Lido e di Malamocco e precisamente in corrispondenza alle località S. Nicolò di Lido e Faro Rocchetta.

A S. Nicolò di Lido (Canale di S. Marco) i saggi vengono raccolti, sia in flusso che in riflusso, durante i periodi di tempo nei quali si ritiene che la velocità di corrente raggiunga i valori più elevati.

A Faro Rocchetta (Canale Rocchetta) i saggi vengono raccolti in prossimità dell'alta e della bassa marea.

La torbidità è espressa in *grammi per metro cubo* (gr./ m.$^3$).

I dati suddetti, rilevati in un determinato istante ed in un singolo punto della laguna, possono dare soltanto una nozione molto approssimata sul trasporto del materiale di sospensione nelle acque lagunari; essi potranno inoltre fornire degli elementi di guida per le ricerche future.

**Salsedine delle acque lagunari.** — Nella tabella vengono raccolti i dati della salsedine delle acque lagunari, rilevati nella mezzaria del Canale di S. Marco tra S. Nicolò di Lido e l'isola di S. Andrea, in corrispondenza delle massime alte e delle minime basse maree di ciascun periodo sigiziale, limitato dai tre giorni che comprendono ogni lunazione. I dati suddetti vengono raccolti allo scopo di definire le variazioni a lungo periodo della salsedine in laguna.

La salsedine è espressa in Cl. ‰ (quantità di cloro in grammi per litro) *ed in salinità* S (quantità di sali in grammi per chilo di acqua).

### SEGNI CONVENZIONALI

», dato mancante; — (••), dato interpolato o calcolato in base ad osservazioni interpolate; — ?, dato incerto.

(1) Rendendosi necessari alcuni lavori alla stazione mareografica di Marghera, situata all'imboccatura del Canale Vittorio Emanuele III, a fianco dell'Emporio dei Sali e Tabacchi, a partire dal mese di Luglio 1928 sono stati utilizzati per lo spoglio e vengono pubblicati i dati mareografici dei diagrammi della seconda stazione pure di Marghera, situata alla Darsena W.
Le quote dei bulloni di riferimento della nuova stazione sono le seguenti:

Bullone interno m. 2,4707 s. l. m. m.
Bullone esterno m. 2,0687 s. l. m. m.

N.B. — I dati sottolineati si riferiscono ad osservazioni influenzate da ondulazioni secondarie di una certa entità.

# METEOROLOGIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Dei vari Osservatori costituenti la Rete Meteorologica del Magistrato alle Acque si pubblicano le osservazioni di alcuni soltanto, scelti in modo da dare un'idea sull'andamento dei principali fenomeni meteorologici della Regione che hanno interesse più o meno diretto con l'Idrologia. Gli stessi criteri hanno servito per la scelta delle stazioni termometriche.

Le osservazioni nella Rete del Magistrato alle Acque si eseguono alle ore 8, 14 e 19 T. M. E., in accordo con l'orario internazionale per le osservazioni sinottiche.

Tutti gli Osservatori sono muniti di strumenti registratori, e alle ore indicate si fanno le letture, tanto ad essi, come agli strumenti a lettura diretta, in modo da apportare in seguito le correzioni del caso.

*Gli strumenti registratori* da cui si fanno gli spogli sono:

*per la pressione:* il barometrografo Agolini;

*per la temperatura:* il termografo, e *per l'umidità:* l'igrografo, tutti e due della ditta Richard;

*per il vento:* l'anemografo Steffens - Marini, ovunque, tranne all'Osservatorio di Treviso e quello del Lido, ove lo spoglio è desunto da un anemografo ad 8 direzioni del Richard;

*per le precipitazioni:* pluviografo Palazzo, oppure tipo M dell'Ufficio Idrografico.

Negli Osservatori principali sono in funzione anche altri tipi di registratori, ai quali si ricorre per l'eventuale interpolazione dei dati, nel caso d'interruzione agli strumenti comuni.

Gli strumenti, tarati all'atto della distribuzione, vengono di quando in quando verificati e controllati.

**Per tutti gli elementi meteorologici, di cui si dà conto nella presente parte « Meteorologia », a differenza di quello che si fa nell'altra parte « Pluviometria », si adotta il giorno civile dalle 0 alle 24.**

Dei diagrammi del termografo, igrografo, barografo si fa lo spoglio, ossia la lettura delle ordinate, ogni due ore.

La media relativa viene calcolata con la formula:

$$m = \frac{1}{12}(l_0 : 2 + l_2 + l_4 + \ldots + l_{22} + l_{24} : 2)$$

Alla media così calcolata si apporta la *correzione* ricavata dal diagramma delle correzioni, ottenuto portando sulle ascisse le letture fatte sul registratore, e sulle ordinate le correzioni dedotte dai confronti con le osservazioni agli strumenti a lettura diretta. Tale metodo si è trovato più rapido e più opportuno di quello di applicare giorno per giorno la correzione ricavata, oppure alla media dell'elemento la media aritmetica delle correzioni.

Per il *vento* si fa lo spoglio ogni ora.

Nella relativa colonna *è segnata la direzione prevalente del vento,* ossia la direzione secondo la quale esso ha soffiato per un maggior numero di ore durante la giornata.

La *media giornaliera* della velocità del vento, espressa in km. ora, è calcolata secondo la formula:

$$m = \frac{1}{24}(l_1 + l_2 + \ldots + l_{23} + l_{24})$$

Per due Osservatori, Belluno, Vicenza e per quelli di II° ordine, non ancora forniti di anemografo, la direzione e forza del vento sono stabilite a stima dall'osservatore.

Per ogni Osservatorio viene pubblicato la massima e minima temperatura giornaliera.

La *nebulosità* è espressa in decimi di cielo coperto, ed è la media aritmetica delle tre osservazioni.

*Note meteorologiche del mese.* — Vengono suggerite dall'esame dei dati raccolti negli Osservatori meteorologici e nelle Stazioni pluviometriche del Compartimento, e delle carte isobariche che si pubblicano nel Bollettino giornaliero dell'Ufficio; queste carte vengono talvolta rettificate in base alle pubblicazioni degli Uffici Meteorologici italiani ed esteri.

I numeri romani preceduti o no dalla parola - tipo - si riferiscono alla classificazione del Fabris (1) alla quale sono state portate leggere modifiche specialmente nei riguardi dei tipi III, XV e XVII.

I valori medi dei vari elementi meteorologici sono stati desunti in generale dai lavori del Prof. F. Eredia pubblicati negli Annali dell'Ufficio Centrale di Meteorologia e Geodinamica di Roma e si riferiscono ad oltre un trentennio di osservazioni. Soltanto per il Venda i valori medi sono stati dedotti da un decennio di osservazioni.

### SEGNI CONVENZIONALI

● Pioggia. - ⚹ Neve. - △ Nevischio. - Gragnuola - ▲ Grandine. - ≡ Nebbia. - ⁝≡ Nebbia piovigginosa. - ═ Nebbia all'orizzonte. - ∨ Brina. - ⊔ Gelo. - ∾ Gelicidio. - ⌂ Rugiada. - ↔ Aghi di ghiaccio. - ∞ Caligine. - ⊼ Temporale. - ⊤ Temporale lontano. - < Lampi senza tuoni. - ≷ Lampi e tuoni. - ⍀ Vento forte. - ⍀ Vento fortissimo. - ∔ Uragano di neve. - ⊖ Alone solare. - ∈ Alone lunare. - ⊕ Corona solare. - ∉ Corona lunare. - ⌒ Arcobaleno.

—, calma, o nessuna precipitazione;

», non giunte le osservazioni; dato mancante o non calcolato;

?, dato incerto;

(·), dato desunto dallo strumento a lettura diretta, invece che dal registratore; se il segno è messo in testa ad una decade, vale per tutti i dati successivi di quella decade;

••, dato interpolato o calcolato in base ad osservazioni interpolate;

Le lettere a p n, che seguono alcuni segni (quei di nebbia, pioggia, neve, grandine, temporale, lampi, tuoni), indicano la parte del giorno (rispettivamente dalle ore 8 alle 12, dalle 12 alle 19 e dalle 19 alle 8), in cui il fenomeno si è verificato.

Se il segno di pioggia, neve, nebbia non è seguito da *nessuna lettera*, vuol dire che il fenomeno ha durato tutto il giorno.

Avvertenze. — I valori massimo e minimo dei singoli elementi per ogni decade sono indicati col carattere grassetto.

# Note meteorologiche del mese di Aprile

(Redatte dal Prof. Dott. G. Crestani)

1. La *media mensile della temperatura* è stata dovunque inferiore al valore medio dedotto da molti anni: la differenza è 1°,4 al Venda, 2°,5 a Rovigo, 2°,9 a Treviso.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Vicenza | Venezia | Padova | Venda | Rovigo | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Aprile 1929 | 8,8 | 10,7 | 10,5 | 8,3 | 10,4 | 10,5 | 10,3 | 10,5 | 7,3 | 10,9 | 9,9 | 11,1 |
| Val. medio | 10,6 | 12,5 | 12,7 | 10,5 | 13,3 | 12,4 | 12,7 | 12,4 | 8,7 | 13,4 | 12,5 | 12,7 |

2. Dopo i forti aumenti della fine del mese precedente, la temperatura, nel suo andamento generale, subì una forte diminuzione al principio di questo sino al 5-8; in questi giorni si ebbe una vera ripresa invernale: neve, vento, freddo e furono segnate le temperature più basse del mese. Successivamente la temperatura riprese il suo andamento generale crescente, ma non regolare; raggiunse un massimo verso il 20, e, dopo un altro minimo, non tanto profondo, ha luogo un terzo massimo alla fine del mese. I tre massimi sono poco differenti fra loro, ad ogni modo, nella maggior parte della regione, al 19-20 sono state segnate le massime diurne più elevate, al 19 al Venda con 15°,9, al 20 a Venezia con 18°,9, a Padova con 21°,2; anche all'1 al Venda erano stati raggiunti i 15°,9; al 28 poi fu raggiunta la massima a Gorizia, Pisino, Treviso, ecc. Le massime di aprile differiscono di poco da quelle del mese precedente, in qualche caso sono anche inferiori. La minima invece fu segnata ovunque durante i giorni di burrasche 5-6-7 e nel giorno sereno successivo, difatti al 5 le minime assolute si verificarono nella vallata dell'Adige e nell'Istria, al 7 al Venda con −2°,5, a Venezia con 1°,0, al 7 e all'8 a Padova con −1°,5.

L'escursione termometrica del mese pertanto è 17°,9 a Venezia, 18°,5 al Venda, 22°,7 a Padova.

3. In 9 giorni (1-8-9-14-19-20-21-25-29) la minima diurna della temperatura al Venda fu inferiore che a Padova, ma la differenza Venda-Padova si tenne relativamente bassa; difatti i valori massimi di tale differenza sono 4°,3 il giorno 8 e il 20 e 3°,0 il 19; tutte e tre le medie decadiche delle minime diurne al Venda sono inferiori alle rispettive medie a Padova.

L'altezza dell'isoterma 0° nelle singole decadi, calcolata dalla temperatura media decadica del Venda e con l'assumere come decremento della temperatura lungo la verticale quello calcolato per l'aria libera della Val Padana, risulta nella prima decade verso i 1500 m., nelle altre due decadi verso i 2000 m. Invece distribuendo opportunamente in vari gruppi a seconda della loro quota gli osservatori e le stazioni termometriche si ha che lo 0° è verso i 1600 m. nella prima decade, esso oltrepassa i 2200 nella seconda e terza decade.

4. I primi giorni del mese sino al 9 possono essere considerati come la continuazione del periodo asciutto che ha occupato tutto il mese precedente; difatti poche e scarse precipitazioni si ebbero qua e là al 5 e 6 (giorni a precipitazioni parziali). Dal 10 al 16 decorre un periodo piovoso, le piogge furono abbastanza copiose al 13 (g. p.) mm. 28,8 a Schio, 48,2 a Recoaro; al 14 (g. p.) mm. 30,5 a Timau, mm. 45,0 a Venzone, mm. 53,0 a Tramonti di Sopra, il 16 (g. p.) mm. 46,0 a Montenero d'Idria, ecc.

Dopo quattro giorni asciutti, al 21, riprendono le precipitazioni che continuano sino alla fine del mese, talora parziali 21-26-27-29, tal altra generali 22-23-30; le maggiori quantità in questo periodo furono al 27 (g. p.) mm. 63,2 a Plezzo (*totale diurno massimo del mese*), mm. 57,0 a Caporetto, mm. 36,4 a Pontebba; al 30 (g. p.) mm. 48,8 a Caporetto, mm. 40,6 a Timau ecc.; in tre giorni 24-25-28 le precipitazioni mancarono quasi del tutto.

Affatto trascurabili le variazioni di livello verificatesi nei fiumi.

5. Nel mese precedente erano rimaste coperte di neve solo le quote superiori ai 2000 m. La neve cadde nel primo periodo del mese, a partire dal 4-5, a quasi tutte le quote; al di sotto dei 1000 m. cadde mista od alternata con pioggia, cosicchè non si fermò sul suolo; anche alle quote maggiori non si ebbe aumento del manto nevoso.

La neve torna a cadere verso l'11 e si ferma al suolo sino al 19 alle quote verso i 1000 m.; invece verso i 2000 m. lo spessore del manto raggiunge il massimo tra il 16 e il 20; oltre i 2000 m. si ha un nuovo rifornimento a quelle quote anche tra il 28 e il 30. Il mese si chiude con uno spessore maggiore che al principio: a Monteneve (m. 2332) cm. 190; tale spessore sensibilmente lo stesso che al principio alle quote subito inferiori; esso oscilla tra i 40-50 mm. verso i 2000 m.; a quote al di sotto dei 1800 m. la neve è scomparsa.

6. La *media mensile della nebulosità* nella maggior parte delle località è stata leggermente superiore al valor medio dedotto da molti anni.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Vicenza | Venezia | Padova | Rovigo | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Aprile 1929 | 6,3 | 5,2 | 5,7 | 5,4 | 6,2 | 5,8 | 6,0 | 6,0 | 6,1 | 6,3 | 5,9 |
| Val. medio | 4,9 | 5,8 | 5,8 | 6,7 | 5,6 | 5,0 | 5,9 | 5,3 | 5,7 | 5,9 | 5,2 |

7. La *quantità delle precipitazioni* fu alquanto inferiore al valor medio calcolato da parecchi anni in pianura (rapporto Padova 0,78, Rovigo 0,55) e nella parte occidentale dell'Alto Adige (rapporto Bolzano 0,65, Silandro 0,86), invece essa fu superiore a tale valore nel rimanente della zona montuosa (rapporto Plezzo 1,28, Belluno 1,09).

| | Fiume | Pisino | Pola | Trieste | Gorizia | Plezzo | Belluno | Conegliano | Treviso | Venezia |
|---|---|---|---|---|---|---|---|---|---|---|
| Aprile 1929 | 142,5 | 87,3 | 71,5 | 93,8 | 111,8 | 214,6 | 114,8 | 66,6 | 44,2 | 61,4 |
| Valore medio | 191,9 | 79,0 | 71,0 | 75,2 | 110,0 | 167,4 | 105,4 | 108,1 | 99,2 | 80,4 |
| Rapporto | 0,74 | 1,10 | 1,00 | 1,11 | 1,02 | 1,28 | 1,09 | 0,61 | 0,45 | 0,77 |

| | Padova | Rovigo | Vicenza | Recoaro | Trento | S. Michele | Bolzano | Silandro |
|---|---|---|---|---|---|---|---|---|
| Aprile 1929 | 59,1 | 37,0 | 87,9 | 178,8 | 46,3 | 59,0 | 41,2 | 26,6 |
| Valore medio | 75,9 | 66,9 | 120,1 | 201,0 | 97,7 | 82,6 | 63,0 | 31,0 |
| Rapporto | 0,78 | 0,55 | 0,73 | 0,93 | 0,47 | 0,71 | 0,65 | 0,86 |

8. L'esame della *carta delle precipitazioni* in questo mese mostra come la fascia dei massimi è abbastanza ben delineata; da una parte di essa in pianura, le precipitazioni s'aggirano attorno ai 50 mm. S'incontrano valori inferiori a 50 mm. dall'altra parte: nell'Alto Adige (Val Venosta, Silandro mm. 21) e in alcune vallate affluenti (Bressanone mm. 43, Cavalese, Avisio mm. 36).

La fascia dei massimi ha una prima area di massimo sui monti Lessini (Lambre mm. 253), è poi intersecata da una striscia di valori al di sotto di 100 mm. nella valle del Meschio (Ceneda mm. 86); inoltre ha un'area di massimo tra l'alto Cellina e l'alto Meduna (Rio Stavalins mm. 250) e un'altra poco lungi attorno al lago di Cavasso (Alesso mm. 224), infine, in un'area abbastanza ampia che abbraccia Monte Cucco, Monte Nero ecc. (in generale si può dire le sorgenti dell'Isonzo, e degli affluenti di sinistra del Torre) sono superati i 200 mm., raggiungendo mm. 269 a Ca' di Caccia mm. 315 a Uccea (*totale mensile massimo*). Sono superati 200 mm. in due zone ristrette: una attorno al Monte Nevoso (Rifugio Gabriele d'Annunzio mm. 255), l'altra attorno a Monte Maggiore ad W di Fiume (mm. 207). La parte occidentale e meridionale dell'Istria è sotto i 100 mm.

9. Di particolare violenza soffiò la bora in tutta la regione nel giorno 6 in cui la media diurna della velocità fu 37,8 al Venda, 46,7 a Venezia, 48,6 a Trieste (dove raggiunse un massimo percorso orario di km. 84, *valore massimo del mese nella regione*) e anche a Padova 20,4, valore davvero insolito per la località e nel giorno 22 in cui la media diurna fu 48,9 km. al Venda, 39,4 a Venezia, 48,3 a Trieste, 16,5 a Padova. Inoltre furono superati i 20 km. nella media diurna al Venda il 2, il 4-5-11-12-13-19-20-23 e 30, a Venezia il 2-4-11-12-30, a Trieste il 2-4-7-17-18 e 23.

In questi giorni il vento prevalente fu sempre attorno ad E; a Trieste e Venezia fa solo eccezione il 30 (vento prevalente da S). Al Venda invece il vento è da NNW il 2, da SW il 5, occidentale il 19-20 e 30, orientale negli altri giorni.

Dall'esame della *rosa dei venti* a 16 direzioni, costruita con lo spoglio orario delle registrazioni dell'anemografo risulta:

A Fiume il settore della rosa a cui spetta la maggiore frequenza è quello da NNW a ENE (40 % a 5 direzioni) con un massimo (11 %) a N; inoltre si presentano altri due massimi l'uno a S (7 %), l'altro a WNW (12 %).

A Trieste la rosa ha la solita forma, le direzioni più frequenti sono quelle orientali da ENE a SE (59 % a 4 direzioni), frammezzate da un minimo a ESE (6 %), v'è poi un massimo secondario a NW (6 %).

A Venezia sono scarse le direzioni da SSW a NNW (17 % a 7 direzioni); tra le altre si presenta un massimo a E (17 %) ed un altro a S (15 %).

Al Venda la rosa ha due lobi pronunciati uno nelle direzioni orientali da NE a SE (51 % a 5 direzioni) con un massimo a E (16 %), l'altro nelle direzioni occidentali (da SW a WNW, 28 % a 4 direzioni) con un massimo a WSW (10 %).

A Padova hanno la prevalenza di gran lunga le direzioni nel 1° quadrante (da N a ENE, 54 % a 4 direzioni); alle direzioni comprese nel settore da SSE a SW spetta 19 % a 4 direzioni.

A Trento si è sviluppato il settore nel 4° quadrante (40 % alle due direzioni NW e NNW) e molto meno il settore nel 2° quadrante (16 % alle due direzioni NE e ENE); alle due direzioni S e SSE spetta 7 %.

10. La *media mensile della pressione atmosferica* è alquanto inferiore al valor normale, l'altezza barometrica di questo mese a Venezia è stata mm. 758,6, mentre il suo valor normale è 759,6 una differenza in difetto di mm. 1.

L'estremo più alto dell'altezza barometrica è stato di mm. 773,1 alle ore 11 del 18, l'estremo più basso è stato di mm. 743,5 alle 10 del 2, una escursione pertanto di mm. 29,6, alquanto superiore al valor medio nella regione che s'aggira attorno ai 22 mm.

Tra le salite del barometro più notevoli sono da noverare: dai mm. 752,0 delle $22^h$ del 15 ai mm. 773,1 delle $11^h$ del 18, mm. 21,1 in 61 ore, pari a mm. 0,35 all'ora; dai mm. 745,3 delle $16^h$ del 2 ai mm. 750,7 delle $22^h$ del 2, mm. 5,4 in 6 ore, pari a mm. 0,9 all'ora.

Tra le discese più notevoli vanno noverate: dai mm. 771,9 delle $0^h$ del 19 ai mm. 755,6 delle 14 del 21, mm. 16,3 in 62 ore, pari a mm. 0,26 all'ora; dai mm. 751,6 delle $21^h$ dell'1 ai mm. 743,5 delle $9^h$ del 2, mm. 8,1 in 12 ore, pari a mm. 0,68 all'ora.

N.B. Le altezze barometriche qui riportate sono dedotte dall'Osservatorio a Venezia (Lido), ridotte a 0° e al livello del mare.

11. L'unito specchietto mostra i *tipi isobarici* presentatisi al mattino alle ore 8 e le *condizioni di tempo* nei riguardi delle precipitazioni, da cui essi furono accompagnati nel corso della giornata (da una mezzanotte all'altra).

| Tipi | III | IIIa | IV | V | VI | VIII | XII | XIII | XIV | XV | XVa | XVIIa | XVIIis | XVIIb | XVIII | * | Totale |

| Totali . . | 2 | 1 | 3 | 1 | 1 | 1 | 3 | 1 | 1 | 5 | 1 | 1 | 1 | 5 | 2 | 1 | 30 |

Il ciclone che al 31 di marzo si trovava sul mar Baltico, nei giorni successivi scese verso Sud, dove si è scisso in due nuclei, il meridionale al 2 ha raggiunto l'Alto Adriatico (XVIIis), naturalmente provocando poche e deboli precipitazioni nella sola Venezia Giulia (tanto che lo classificammo giorno quasi sereno), al 3 ha raggiunto l'Italia meridionale e al 4 l'Ionio e di lì l'Egeo; il nucleo più settentrionale al 2 è sui confini tra la Germania, la Boemia e la Polonia, al 3 è sulla Besserabia, al 4 è fuori d'Europa.

Il periodo sereno è brevemente interrotto da poche piogge parziali il 6 per la presenza del ciclone nell'alto Tirreno, ciclone che proveniva dal Belgio (5) e che è passato all'Italia meridionale (7) e di qui al mare di Marmara (8).

Al 10 ha inizio un periodo di precipitazioni, quando la striscia di bassa pressione che al 9 va dall'Oceano polare alle coste Marocchine ha dato luogo a un ciclone a 758 sulle coste Baltiche e un secondario a mm. 760 sul Mediterraneo occidentale; tale striscia, pur ritirandosi sempre più a Sud alle dipendenze del ciclone centrato nell'Algeria, mantiene in minor pressione il Mediterraneo occidentale.

Le precipitazioni, fattesi parziali al 14, ritornano generali al 15, quando il ciclone, che al 14 era sull'Oceano atlantico, avanza attraverso il Golfo di Guascogna, scende sull'Italia settentrionale la sera del 15, e passa nella penisola Balcanica al 16 mattina, mentre è avanzato un anticiclone che al 17 occupa l'Europa dai Pirenei alla Polonia, portando quindi il sereno che continua sino a che questo anticiclone, attraverso l'Europa, i Balcani, scende al 20 nel Mediterraneo. Ma intanto i cicloni che sino al 17 avevano la loro traiettoria da W ad E sul Mar glaciale, mantenendo fisso il loro punto d'arrivo al mar di Cara, modificano il loro approdo sull'Europa dall'Atlantico: al 20 approdano al Golfo di Guascogna, al 21 alla Penisola Iberica, al 22 attraverso lo stretto di Gibilterra, al 23 s'affacciano all'Algeria. Al 22 anche la nostra regione passa in regime ciclonico e hanno inizio le precipitazioni che continuano sino al 23; al 24 il nucleo ciclonico settentrionale, trovandosi a 747 mm. a Stocolma, e quello Mediterraneo sull'Italia meridionale, cessano le precipitazioni nelle nostre regioni. Si hanno due giorni 26 e 27 di precipitazioni parziali per la presenza di una depressione nel Mediterraneo occidentale (XV), al 29 (tipo IIIa) precipitazioni parziali, al 30 (III) precipitazioni generali, perchè il ciclone dall'atlantico avanza sull'Europa centrale.

12. Le differenze di altezza e di orario tra la marea reale e quella prevista con l'analisi armonica sono state piccole in tutto il mese; le differenze di livello maggiori sono: 32 cm. nell'alta marea del 30, 25 cm. nell'alta marea del 29 (reale > prevista) in tutti e due i casi. E' notevole poi anche la differenza del 6 in cui per tutto il giorno il livello reale si mantenne una ventina di cm. superiore al previsto, tutte le altre variazioni in generale sono più piccole. Esse furono negative (reale < prevista) dal 18 al 23; furono nulle o positive nel resto del mese.

# PLUVIOMETRIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Le tabelle contengono le osservazioni giornaliere ed i totali mensili delle precipitazioni verificatesi a tutte le stazioni della rete del Magistrato, raggruppate per **bacini principali** (o gruppi di bacini principali)

e per **pianure**, limitate dai principali corsi d'acqua della regione e così denominate:

| | |
|---|---|
| **pianura orientale** | *a*) fra Isonzo e Tagliamento<br>*b*) fra Tagliamento e Piave |
| **pianura occidentale** | *a*) fra Piave e Brenta<br>*b*) fra Brenta e Adige |
| **pianura polesana** | fra Adige e Po |

In apposita colonna vengono dati inoltre i nomi dei bacini secondari a cui appartengono le stazioni pluviometriche.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni pluviografiche sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dallo strumento a lettura diretta invece che dal registratore.

Le precipitazioni vengono generalmente misurate al mattino, alle ore 9, e assegnate al giorno in cui venne eseguita l'osservazione; comprendono sia la pioggia che la neve fusa.

I dati giornalieri ricavati dai diagrammi pluviografici comprendono le quantità di pioggia registrate dalle ore 9 del giorno precedente alle ore 9 del giorno che si considera.

Per ogni stazione è indicato il numero dei giorni con precipitazioni uguali o superiori ad 1 millimetro.

*Manto nevoso.* — Nella tabella vengono raccolte le altezze giornaliere del manto nevoso in cm. per alcune stazioni; per ogni stazione è segnata in grassetto la massima altezza raggiunta dalla neve durante il mese.

Su quattro cartine allegate al bollettino sono indicate le altezze del manto nevoso per alcune stazioni nei giorni indicati nelle cartine stesse.

In corrispondenza alle stazioni il cui nome per ragioni di spazio è abbreviato sono segnate in nero le quote s. l. m., ed in rosso le altezze della neve osservate in quel giorno.

Le altezze del manto nevoso vengono misurate con un'asta metrica posta nelle immediate vicinanze del pluvionivometro; esse danno quindi l'altezza del manto nevoso soltanto per il punto di misura.

### SEGNI CONVENZIONALI

P, pluviometro a superficie ricevente di 1/10 di m.²;
Pn, pluvionivometro id. id. id. id.
Pa, pluviometro a superficie ricevente di 1/20 di m.²;
Pv, pluvionivometro id. id. id. id.
Pr, pluviografo;

—, nessuna precipitazione;
*, neve;
•, pioggia;
n, precipitazioni avvenute sotto forma di neve non misurata;

», non giunte le osservazioni; dato mancante;
?, dato incerto;
(•), dato desunto dallo strumento a lettura diretta invece che dal registratore.

**Avvertenze.** — I valori massimi giornalieri delle precipitazioni sono indicati col carattere grassetto.

# REGIME DEI CORSI D'ACQUA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

**Altezze idrometriche giornaliere.** — Vengono raccolte in questa tabella le osservazioni eseguite agli idrometri principali, in funzione lungo i corsi d'acqua più importanti della regione.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni provviste di idrometrografo sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dalla lettura all'idrometro invece che dal registratore.

Nella II parte (annua) del Bollettino vengono riportate le caratteristiche di tutti gli idrometri della rete del Magistrato.

I valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese.

Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere *ordinario* sono *sopra* lo zero idrometrico, quelle stampate in carattere *minuscolo* e distinte dal segno — posto al di sopra di ognuna di esse, sono *sotto* lo zero idrometrico.

**Deflussi giornalieri e mensili.** — Per le principali stazioni per misure di portata vengono in questa tabella raccolti i valori seguenti: altezze idrometriche giornaliere, portate in mc. al secondo giornaliere e mensili, deflussi giornalieri e mensili.

Per le stazioni con idrometro a lettura diretta si è assunto come valore della portata giornaliera quello che corrisponde all'altezza osservata il giorno stesso all'idrometro di stazione. Per le stazioni fornite di registratore, si è assunta come portata giornaliera, quella corrispondente alla media delle altezze registrate ogni sei ore e, nel caso di notevoli variazioni del livello, quella corrispondente alla media delle altezze orarie.

I valori delle portate desunti dalle relative curve, vengono corretti mediante la curva di Stout, determinata in base alle variazioni verificatesi nelle singole sezioni.

I valori più elevati del mese sono stampati in grassetto, quelli più bassi in corsivo e sottolineati.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato e per secondo, calcolato per le portate massima, minima e media del mese.

**Misure di portata.** — La tabella riporta l'elenco ed i risultati delle misure di portata eseguite nel mese a cura dell'Ufficio. Per ognuna di esse viene indicato il bacino imbrifero in kmq. ed il contributo per kmq. in litri al secondo.

**Materiale in sospensione nell'acqua dei fiumi.** — Viene determinato e pubblicato: per l'**Isonzo** a *Salcano*, per il **Tagliamento** a *Venzone* e *Latisana*, per il **Piave** a *Belluno* (Borgo Piave), per il **Brenta** a *Bassano* e *Codevigo*, per il **Frassine** a *Borgo Frassine*, per l'**Adige** a *Pescantina* e *Boara Pisani*.

### SEGNI CONVENZIONALI

I, idrometro;
Ir, idrometro registratore;
», non giunte le osservazioni; dato mancante;

?, dato incerto;
(•), dato desunto dalle letture all'idrometro invece che dal registratore;
(••), dato interpolato;

°• idrometro o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chiusura dei sostegni di navigazione, oppure dalle manovre degli impianti per derivazione d'acqua.

(*) Nella portata unitaria e integrale è anche considerata la portata del canale di derivazione per l'irrigazione dell'Alto Agro Veronese. Tale portata, variabile continuamente, in quanto è influenzata da numerose chiaviche di presa, non è possibile determinare giorno per giorno. Risulta però trattarsi di portate che non superano mai in autunno-inverno i m.³ 3 ed in primavera-estate i m.³ 16. Calcolando per l'inverno una portata media di 2 m.³ e per la primavera-estate di 15 m.³ veniamo a commettere nel calcolo della portata integrale dell'Adige un errore del tutto trascurabile, in relazione ai limiti di tolleranza che ci siamo proposti nelle misure di portata. Nei valori delle portate e dei deflussi è inoltre considerata la portata, derivata mediante sollevamento meccanico, del canale d'irrigazione di sinistra dell'Adige.

## Misure di portata eseguite nel mese

| N. d'ordine | Bacino principale | Corso d'acqua | Località | Giorno | Idrometro | Altezza idrometrica | Sezione liquida in mq. | Portata m. c. al secondo | Bacino imbrifero in kmq. | Contributo per kmq. in litri |

# GEOIDROLOGIA

Le osservazioni freatimetriche vengono effettuate dieci volte al mese nei giorni 2-5-8-11-14-17-20-23-26-29, al mattino, prima degli ordinari attingimenti d'acqua.

Le stazioni sono elencate in relazione alla progressiva distanza dall'asse dei corsi d'acqua e procedendo da monte a valle. I nomi stampati in grassetto indicano che la stazione è fornita di apparato registratore dei livelli freatici.

Le quote del pelo d'acqua nei pozzi sono tutte riferite al livello medio del mare. Per la pianura fra Tagliamento e Torre, per quelle del Brenta e dell'Adige le quote dei pozzi sono state desunte dalle tavolette al 25.000 dell'Istituto Geografico Militare e devono pertanto ritenersi approssimate; per gli altri pozzi le quote sono state determinate mediante livellazione geometrica.

### SEGNI CONVENZIONALI

°, idrometro a lettura diretta o registratore posto in località ov'è sentito l'influsso della marea o delle manovre degli impianti per derivazione d'acqua;
», non giunte le osservazioni, dato mancante;
?, dato incerto.

## Osservazioni freatimetriche e variazioni freatiche in relazione alle condizioni idrometriche

# MAREOGRAFIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Tutte le altezze di marea pubblicate nel bollettino sono espresse in centimetri e riferite ad una superficie ideale di base situata a m. 1.50 sotto il livello medio del mare, origine della rete altimetrica dello Stato, (si ottengono così nelle altezze di marea valori sempre positivi).

Le letture dirette delle altezze di marea, per il controllo del funzionamento degli apparati registratori, sono effettuate a partire da uno speciale bullone (caposaldo) quotato mediante collegamento di precisione coi caposaldi della rete altimetrica suddetta.

Le altezze di marea di Trieste invece sono riferite, dal Gennaio 1929 in poi, ad un piano ideale posto a 150 cm. sotto il livello medio determinato dal Prof. Hopfner sulla base dei dati orari del 1911. Tale livello medio si trova a cm. 252.9 sotto il caposaldo verticale dell'I. G. M., fissato alla parete interna NE della cabina mareografica.

Per riferire al suddetto piano ideale tutti i dati pubblicati nei bollettini dell'Ufficio Idrografico dal luglio 1926 a tutto dicembre 1928 si devono aumentare i dati stessi di 5 cm.

In tal modo possiamo dare le altezze di marea riferite al livello medio del mare, che abbiamo assunto come fondamentale in prima approssimazione, in attesa di stabilirlo definitivamente, in base a lunghe serie di osservazioni mareografiche.

I tempi sono calcolati sul tempo medio Etneo (T. M. E. C.).

Le stazioni mareografiche, delle quali si pubblicano i dati, sono state scelte:

Tabelle I e II. — Per lo studio del fenomeno di marea nell'Adriatico: Marano Lagunare, Porto Falconera, Diga Sud del Porto di Lido, San Felice di Chioggia (entro il Porto di Chioggia); Trieste, Ancona, Viesti.

Tabella III. — Per lo studio del fenomeno di marea entro la Laguna di Venezia: oltre a Diga Sud del Porto di Lido, Punta della Salute (Venezia, bacino di S. Marco), Porto industriale di Marghera. (1)

Tabella IV. — Per lo studio del fenomeno di marea agli estremi limiti della laguna ed in relazione agli studi di bonifica: Conche (vecchie foci della Brenta in laguna di Chioggia), Pagliaga (confluenza del fiume Dese con il canale Osellino presso la foce in laguna), Brondolo (fiume Brenta, alla confluenza del canale di Valle, presso la foce).

Tabella V. — Questa tabella dà i valori massimi e minimi raggiunti dal livello del mare nel mese, con le relative escursioni.

Tabella VI. — La tabella dà la massima ampiezza di marea osservata nel mese, sia fra alta e bassa come fra bassa ed alta marea consecutive.

**Materiale in sospensione nelle acque lagunari.** — In questa tabella vengono raccolti i dati relativi al materiale in sospensione nelle acque lagunari all'interno dei Canali Porti di Lido e di Malamocco e precisamente in corrispondenza alle località S. Nicolò di Lido e Faro Rocchetta.

A S. Nicolò di Lido (Canale di S. Marco) i saggi vengono raccolti, sia in flusso che in riflusso, durante i periodi di tempo nei quali si ritiene che la velocità di corrente raggiunga i valori più elevati.

A Faro Rocchetta (Canale Rocchetta) i saggi vengono raccolti in prossimità dell'alta e della bassa marea.

La torbidità è espressa in *grammi per metro cubo* (gr./ m.³).

I dati suddetti, rilevati in un determinato istante ed in un singolo punto della laguna, possono dare soltanto una nozione molto approssimata sul trasporto del materiale di sospensione nelle acque lagunari; essi potranno inoltre fornire degli elementi di guida per le ricerche future.

**Salsedine delle acque lagunari.** — Nella tabella vengono raccolti i dati della salsedine delle acque lagunari, rilevati nella mezzaria del Canale di S. Marco tra S. Nicolò di Lido e l'isola di S. Andrea, in corrispondenza delle massime alte e delle minime basse maree di ciascun periodo sigiziale, limitato dai tre giorni che comprendono ogni lunazione. I dati suddetti vengono raccolti allo scopo di definire le variazioni a lungo periodo della salsedine in laguna.

La salsedine è espressa in Cl. ‰ (quantità di cloro in grammi per litro) *ed in salinità* S (quantità di sali in grammi per chilo di acqua).

### SEGNI CONVENZIONALI

», dato mancante; — (••), dato interpolato o calcolato in base ad osservazioni interpolate; — ?, dato incerto.

(1) Rendendosi necessari alcuni lavori alla stazione mareografica di Marghera, situata all'imboccatura del Canale Vittorio Emanuele III, a fianco dell'Emporio dei Sali e Tabacchi, a partire dal mese di Luglio 1928 sono stati utilizzati per lo spoglio e vengono pubblicati i dati mareografici dei diagrammi della seconda stazione pure di Marghera, situata alla Darsena W.

Le quote dei bulloni di riferimento della nuova stazione sono le seguenti:

Bullone interno m. 2,4707 s. l. m. m.
Bullone esterno m. 2,0687 s. l. m. m.

N.B. — I dati sottolineati si riferiscono ad osservazioni influenzate da ondulazioni secondarie di una certa entità.

## Ore ed altezze delle alte e basse maree — Tabella I.

# METEOROLOGIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Dei vari Osservatori costituenti la Rete Meteorologica del Magistrato alle Acque si pubblicano le osservazioni di alcuni soltanto, scelti in modo da dare un'idea sull'andamento dei principali fenomeni meteorologici della Regione che hanno interesse più o meno diretto con l'Idrologia. Gli stessi criteri hanno servito per la scelta delle stazioni termometriche.

Le osservazioni nella Rete del Magistrato alle Acque si eseguono alle ore 8, 14 e 19 T. M. E., in accordo con l'orario internazionale per le osservazioni sinottiche.

Tutti gli Osservatori sono muniti di strumenti registratori, e alle ore indicate si fanno le letture, tanto ad essi, come agli strumenti a lettura diretta, in modo da apportare in seguito le correzioni del caso.

*Gli strumenti registratori* da cui si fanno gli spogli sono:

*per la pressione:* il barometrografo Agolini;

*per la temperatura:* il termografo, e *per l'umidità:* l'igrografo, tutti e due della ditta Richard;

*per il vento:* l'anemografo Steffens - Marini, ovunque, tranne all'Osservatorio di Treviso e quello del Lido, ove lo spoglio è desunto da un anemografo ad 8 direzioni del Richard;

*per le precipitazioni:* pluviografo Palazzo, oppure tipo M dell'Ufficio Idrografico.

Negli Osservatori principali sono in funzione anche altri tipi di registratori, ai quali si ricorre per l'eventuale interpolazione dei dati, nel caso d'interruzione agli strumenti comuni.

Gli strumenti, tarati all'atto della distribuzione, vengono di quando in quando verificati e controllati.

**Per tutti gli elementi meteorologici, di cui si dà conto nella presente parte «Meteorologia», a differenza di quello che si fa nell'altra parte «Pluviometria», si adotta il giorno civile dalle 0 alle 24.**

Dei diagrammi del termografo, igrografo, barografo si fa lo spoglio, ossia la lettura delle ordinate, ogni due ore.

La media relativa viene calcolata con la formula:

$$m = \frac{1}{12}(l_0 : 2 + l_2 + l_4 + \dots + l_{22} + l_{24} : 2)$$

Alla media così calcolata si apporta la *correzione* ricavata dal diagramma delle correzioni, ottenuto portando sulle ascisse le letture fatte sul registratore, e sulle ordinate le correzioni dedotte dai confronti con le osservazioni agli strumenti a lettura diretta. Tale metodo si è trovato più rapido e più opportuno di quello di applicare giorno per giorno la correzione ricavata, oppure alla media dell'elemento la media aritmetica delle correzioni.

Per il *vento* si fa lo spoglio ogni ora.

Nella relativa colonna *è segnata la direzione prevalente del vento,* ossia la direzione secondo la quale esso ha soffiato per un maggior numero di ore durante la giornata.

La *media giornaliera* della velocità del vento, espressa in km. ora, è calcolata secondo la formula:

$$m = \frac{1}{24}(l_1 + l_2 + \dots + l_{23} + l_{24})$$

Per due Osservatori, Belluno, Vicenza e per quelli di II° ordine, non ancora forniti di anemografo, la direzione e forza del vento sono stabilite a stima dall'osservatore.

Per ogni Osservatorio viene pubblicato la massima e minima temperatura giornaliera.

La *nebulosità* è espressa in decimi di cielo coperto, ed è la media aritmetica delle tre osservazioni.

*Note meteorologiche del mese.* — Vengono suggerite dall'esame dei dati raccolti negli Osservatori meteorologici e nelle Stazioni pluviometriche del Compartimento, e delle carte isobariche che si pubblicano nel Bollettino giornaliero dell'Ufficio; queste carte vengono talvolta rettificate in base alle pubblicazioni degli Uffici Meteorologici italiani ed esteri.

I numeri romani preceduti o no dalla parola - tipo - si riferiscono alla classificazione del Fabris (1) alla quale sono state portate leggere modifiche specialmente nei riguardi dei tipi III, XV e XVII.

I valori medi dei vari elementi meteorologici sono stati desunti in generale dai lavori del Prof. F. Eredia pubblicati negli Annali dell'Ufficio Centrale di Meteorologia e Geodinamica di Roma e si riferiscono ad oltre un trentennio di osservazioni. Soltanto per il Venda i valori medi sono stati dedotti da un decennio di osservazioni.

### SEGNI CONVENZIONALI

● Pioggia. - ✳ Neve. - △ Nevischio. - Gragnuola - ▲ Grandine. - ≡ Nebbia. - !≡ Nebbia piovigginosa. - ≡ Nebbia all'orizzonte. - V Brina. - ⊔ Gelo. - ∾ Gelicidio. - ⌂ Rugiada. - ↔ Aghi di ghiaccio. - ∞ Caligine. - ⏋ Temporale. - T Temporale lontano. - < Lampi senza tuoni. - ⌇ Lampi e tuoni. - ⅂ Vento forte. - ⅂ Vento fortissimo. - ∔ Uragano di neve. - ⊖ Alone solare. - ( Alone lunare. - ⊕ Corona solare. - ϑ Corona lunare. - ⌒ Arcobaleno.

—, calma, o nessuna precipitazione;

», non giunte le osservazioni; dato mancante o non calcolato;

?, dato incerto;

(*), dato desunto dallo strumento a lettura diretta, invece che dal registratore; se il segno è messo in testa ad una decade, vale per tutti i dati successivi di quella decade;

**, dato interpolato o calcolato in base ad osservazioni interpolate;

Le lettere a p n, che seguono alcuni segni (quei di nebbia, pioggia, neve, grandine, temporale, lampi, tuoni), indicano la parte del giorno (rispettivamente dalle ore 8 alle 12, dalle 12 alle 19 e dalle 19 alle 8), in cui il fenomeno si è verificato.

Se il segno di pioggia, neve, nebbia non è seguito da *nessuna lettera*, vuol dire che il fenomeno ha durato tutto il giorno.

Avvertenze. — I valori massimo e minimo dei singoli elementi per ogni decade sono indicati col carattere **grassetto**.

# Note meteorologiche del mese di Maggio

(Redatte dal Prof. Dott. G. Crestani)

1. La *media mensile della temperatura* è stata dappertutto (ad eccezione di Trento) superiore al valor medio. L'eccesso è superiore ad 1° in tutte le località, tranne che al Venda e a Rovigo, dov'è rispettivamente di 0°,5 e 0°,6.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Venda | Rovigo | Vicenza | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Maggio 1929 | 16,7 | 18,8 | 18,6 | 15,4 | 18,5 | 18,5 | 18,1 | 15,2 | 18,4 | 18,3 | 15,9 | 17,5 |
| Val. medio | 15,0 | 17,1 | 16,9 | 14,4 | 17,5 | 17,2 | 16,8 | 14,7 | 17,8 | 16,6 | 16,4 | 16,6 |

2. La temperatura nel corso del mese ha un andamento generale crescente: l'ondata di freddo verso il 20 porta temperature non inferiori alle minime del principio. Alla fine del mese si hanno le temperature più elevate.

Le temperature minime del mese sono distribuite tra l'1 e il 6: all'1 a Padova con 7°,1, a Venezia con 8°,5, al 4 al Venda con 6°,5, ecc.

Le temperature massime del mese sono distribuite dal 29 al 30: al 29 a Venezia con 28°,8, al 30 a Padova con 30°,9, al Venda con 25°,9; solo nell'Istria le massime furono segnate al 25 e 26.

L'escursione termometrica del mese è stata di 19°,5 al Venda, 20°,3 a Venezia, 23°,8 a Padova.

3. In 17 giorni (1-5-6-7-8-10-13-14-17-21-23-24-25-26-28-29-31) la minima diurna della temperatura al Venda fu inferiore che a Padova, ma la differenza Venda - Padova si tenne sempre bassa, in molti casi non superò il mezzo grado; i valori massimi sono: 1°,9 all'8 e 2°,7 al 14. La seconda media decadica della minima diurna al Venda è inferiore a quella di Padova, le altre due invece sono superiori, di 0°,4 la prima, di 0°,3 la terza.

L'*altezza dell'isoterma 0°* nelle singole decadi (calcolata dalla temperatura media decadica del Venda ed avendo assunto come decremento della temperatura lungo la verticale quello calcolato per l'aria libera nella Val Padana) risulta nella prima decade verso i 2600 m., nella seconda verso i 2900 e nella terza oltre i 3000 metri.

Invece, distribuendo gli osservatori e le stazioni termometriche in vari gruppi a seconda della loro quota, si hanno i seguenti valori medi della temperatura:

| Altezza m. sul livello del mare | 31 | 311 | 576 | 944 | 1250 | 1528 | 1832 | 2151 |
|---|---|---|---|---|---|---|---|---|
| Temper. media prima decade . | 15,6 | 13,9 | 12,2 | 10,9 | 7,7 | 7,4 | 6,1 | 3,8 |
| Temper. media seconda decade . | 19,1 | 16,8 | 14,6 | 13,6 | 10,7 | 9,3 | 7,9 | 4,9 |
| Temper. media terza decade . . | 21,7 | 19,3 | 17,2 | 16,4 | 14,0 | 12,8 | 10,8 | 9,9 |
| Temperatura media mensile . . | 18,8 | 16,7 | 14,7 | 13,6 | 10,8 | 9,8 | 8,3 | 6,2 |

Appare subito da questo specchio come alle varie quote, analogamente a quello che abbiamo visto in basso, la temperatura cresca rapidamente passando dalla prima alla seconda e dalla seconda alla terza decade, e come alla quota massima di osservazione la temperatura sia ancora sensibilmente sopra zero.

4. Continua sino al 4 il *periodo piovoso* che aveva avuto inizio al 21 del mese precedente, le piogge furono copiose al 3, mm. 27,4 a Conegliano, mm. 21,9 a Vicenza.

Dopo tre giorni quasi asciutti le precipitazioni riprendono all'8 e continuano sino al 20 con due giorni d'interruzione al 13 e al 17; al 14 (g. p.) Bassano mm. 50,2 (*totale diurno massimo del mese*), al 16 (g. p.) Mareson di Zoldo mm. 45,5.

A quattro giorni asciutti (dal 21 al 24) seguono tre giorni dal 25 al 27 a precipitazioni parziali (esse mancano in pianura) e, dopo due altri giorni quasi asciutti che, come vedemmo furono i più caldi del mese, ovunque al 30 si hanno perturbamenti temporaleschi in tutta la regione, con precipitazioni quasi generali, ma senza che assumano valori elevati. Forti furono le manifestazioni elettriche e qua e là caddero grandinate devastatrici (per esempio nel Padovano) e si ebbero violente raffiche. Queste ultime assunsero violenza particolare, quantunque di non molta durata, nella laguna di Venezia che ne fu tutta sconvolta tanto improvvisamente e furiosamente, che parecchie barche si rovesciarono e molte si salvarono a stento. Al 31 le precipitazioni furono parziali.

Deboli in genere furono le variazioni del livello dei fiumi; al 4-5 un leggero aumento appena avvertibile al Tagliamento, Livenza, Frassine, al 17-18 all'Adige, al 20-21 al solo Frassine.

5. Nell'interno nella zona montuosa la precipitazione nei primi giorni del mese è *acqua e neve* nelle quote sotto ai 2000 m. circa, cosicchè la neve ch'era rimasta a quote inferiori va rapidamente diminuendo e scompare presto; invece ai Passi verso i 2000 m. (Passo Sella, Passo Pordoi, ecc.) vi rimane tutto il mese, lentamente diminuendo. A Monteneve (m. 2332) il manto nevoso raggiunge lo spessore massimo con cm. 320 al 3, ma poi diminuisce, salvo un leggero rifornimento di 10 cm. al 15; all'ultimo del mese lo spessore è cm. 30, mentre a Passo Pordoi è cm. 5.

6. La media mensile della *nebulosità* è alquanto inferiore al valor medio nella Venezia Giulia e nelle Prealpi Bellunesi, invece è leggermente superiore altrove.

| | Trieste | Gorizia | Belluno | Treviso | Vicenza | Venezia | Padova | Rovigo | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|
| Maggio 1929 | 4,4 | 4,4 | 5,3 | 6,1 | 5,4 | 5,2 | 5,8 | 5,3 | 6,6 | 6,2 |
| Val. medio | 6,2 | 5,6 | 7,2 | 5,8 | 5,0 | 5,9 | 5,3 | 5,4 | 6,3 | 5,4 |

7. La *quantità delle precipitazioni* cadute in questo mese è inferiore al valor medio calcolato da parecchi anni nella Venezia Giulia (rapporto Trieste 0,44, Pisino 0,69) e nel Polesine, in relazione anche con la minore nebulosità (§ 6), altrove invece essa poco differisce da tale valor medio, tranne che nelle Prealpi Bellunesi, dove lo supera notevolmente (Belluno il rapporto 1,61).

| | Fiume | Trieste | Pisino | Gorizia | Plezzo | Belluno | Treviso | Venezia |
|---|---|---|---|---|---|---|---|---|
| Maggio 1929 | 39,0 | 42,1 | 75,6 | 97,4 | 182,4 | 232,4 | 124,5 | 67,6 |
| Valore medio | 119,0 | 95,3 | 108,8 | 146,0 | 239,0 | 144,9 | 120,7 | 76,6 |
| Rapporto | 0,33 | 0,44 | 0,69 | 0,67 | 0,76 | 1,61 | 1,03 | 0,88 |
| | **Padova** | **Rovigo** | **Vicenza** | **Recoaro** | **Trento** | **S. Michele** | **Bolzano** | **Silandro** |
| Maggio 1929 | 99,6 | 53,4 | 103,2 | 197,2 | 119,4 | 93,2 | 88,6 | 69,2 |
| Valore medio | 97,9 | 90,8 | 144,0 | 260,0 | 113,9 | 99,0 | 74,6 | 60,0 |
| Rapporto | 1,02 | 0,59 | 0,72 | 0,76 | 1,05 | 0,94 | 1,19 | 1,15 |

8. L'esame della *carta delle precipitazioni* mostra come la fascia dei massimi è avvolta dall'isoieta 200 mm. che corre lungo i piedi delle Prealpi, entra nel massicio montuoso lasciando a E il Tagliamento, passa poco a S di S. Stefano di Cadore (mm. 159) e poi per Cortina (mm. 210), Passo Rolle (mm. 203), lascia a E Trento (m. 127), scende per la Val Arsa e poi abbracciando Campo d'Albero mm. 257) risale verso NE lungo i piedi delle Prealpi (Schio mm. 196). In questa striscia si riconoscono le seguenti aree di massimo: una ristretta ad E del Monte Verena, altopiano Sette Comuni (Ghertele mm. 326), un'altra a S di Belluno, tra il Piave ed il Meschio (S. Boldo mm. 362, *totale massimo del mese*), un'altra infine alle sorgenti del Meduna (Tramonti di Sotto mm. 356).

Caporetto, Plezzo, Resia, sono avvolte dall'isoieta 200 mm., ma nel loro interno la quantità di precipitazione, contro il solito, non cresce molto. Sulle Alpi Giulie e l'Istria (esclusa la metà meridionale che ha mm. tra 30 e 50) le precipitazioni sono tra 50-70 mm.

L'isoieta 100 partendo da Circhina, bacino dell'Idria, (mm. 106) passa per Gorizia (mm. 100), per Udine (mm. 99), per Codroipo (mm. 104), lascia a N Treviso (mm. 125), Mestre (mm. 112), lascia a S Rovigo (mm. 54) e costeggiando l'Adige raggiunge il Lago di Garda.

Nella parte occidentale dell'alto Adige le precipitazioni sono tra 70 e 100 mm. (Silandro mm. 69, Bolzano mm. 93).

9. La *media diurna del vento* superò i 20 km./h al Venda in 8 giorni (1-12-15-16-19-25-26-27); la media più alta spetta al 19 con km/h 27,9, vento prevalente da ENE, la velocità oraria massima si verificò al 16 con 54 km./h da NNE dalle 3h alle 4h. In tutti questi giorni il vento prevalente fu dal 1° quadrante, tranne l'1 in cui prevalse vento da WSW. A Venezia i 20 km. furono superati in tre giorni (15-16-19), con un massimo di 22,7 il 19, la velocità oraria massima fu il 15 con 44 km. da WNW dalle 18h alle 19h. Il vento prevalente fu da NNE il 15 e 19, da WNW al 16. A Trieste tale limite fu superato in 7 giorni (11-12-13-16-20-21-27) con un massimo di 25,0 km. al 27. La velocità oraria massima fu 45,0 km., segnata in parecchi giorni; vento prevalente sempre da ENE. A Padova solo in un giorno (15) la velocità media superò i 10 km./h, raggiungendo km./h 10,3; vento prevalente da NNW, velocità oraria massima km. 29 da SW dalle 17h alle 18h.

Dall'esame della *rosa dei venti a 16 direzioni*, costruita con lo spoglio orario delle registrazioni dell'anemografo, risulta:

A Fiume il settore a cui spetta la maggiore frequenza è quello che comprende le direzioni settentrionali da W ad E (80 % a 9 direzioni) con un massimo a WNW (15 %), un altro a NNW (11 %) e un terzo a ENE (13 %).

A Trieste è molto sviluppato il settore orientale da SE a ENE (53 % a 4 direzioni), mentre alle 4 direzioni da W a NNW spetta 22 %.

A Venezia è molto sviluppato il settore orientale da NNE a S (65 % a 8 direzioni) con un massimo a NE (11 %) e un altro a S (11 %). Tra le rimanenti spetta un massimo a WNW (7 %).

Al Venda la rosa ha la solita forma: un lobo orientale che comprende le direzioni da N ad E (46 % a 4 direzioni) con un massimo a NE (16 %) e un altro lobo occidentale da WNW a SW (25 % a 4 direzioni) con un massimo a WSW (8 %).

A Padova le direzioni meno frequenti sono comprese nel settore da SE a SSW, (15 % a 5 direzioni); tra le altre spetta la frequenza massima alle due direzioni N e NNW (12 % per ciascuna).

A Trento la rosa ha la solita forma trilobata, però il lobo meridionale è il meno pronunciato degli altri due (SSE 4 %); invece il lobo del 4° quadrante ha il massimo a NNW (21 %), quello del 1° quadrante a ENE (20 %).

10. La *media mensile della pressione atmosferica* anche in questo mese è alquanto inferiore al suo valor normale; l'altezza barometrica di questo mese a Venezia è stata di mm. 759,7, mentre il suo valor normale è di mm. 760,3; una differenza pertanto di mm. 0,6.

Il valor massimo raggiunto dall'altezza barometrica è stato di mm. 767,1 alle ore 10 del 5, mentre il minimo è stato mm. 754,4 alle ore 18 del 15, un'escursione pertanto di mm. 12,7, alquanto inferiore al suo valor medio nella regione, dove s'aggira attorno ai mm. 17.

Durante questo mese le variazioni del barometro sono state piccole e in generale molto lente.

Tra le salite più degne di nota va ricordata solo quella da mm. 759,1 delle 2h del 14 ai mm. 767,1 delle 10h del 5, ossia mm. 8,0 in 32 ore, pari a mm. 0,25 all'ora.

Tra le discese degne di nota va ricordata quella dai mm. 759,9 delle 12h del 30 ai mm. 756,8 delle 17h del 30, ossia mm. 3,1 in 5 ore, pari a mm. 0,62 all'ora.

N.B. Le altezze barometriche qui riportate sono dedotte dall'Osservatorio di Venezia (Lido), ridotte a 0° e al livello del mare.

11. L'unito specchietto mostra i *tipi isobarici* presentatisi al mattino alle ore 8 e le *condizioni di tempo* nei riguardi delle precipitazioni da cui essi furono accompagnati nel corso della giornata (da una mezzanotte all'altra).

| Tipi | II | IIIa | VI | VII | VIII | X | XI | XIV | XVIb | XVIIb | XVIII | * | Totale |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Con precipitazioni generali . . | — | 1 | 1 | — | 1 | 1 | — | 1 | 1 | 1 | 1 | 3 | 11 |
| Con precipitazioni parziali . . | — | — | — | 1 | 1 | 2 | 1 | — | — | — | 2 | 1 | 8 |
| Senza precipitazioni . . . | 1 | — | — | — | 1 | — | 1 | 3 | — | — | 3 | 3 | 12 |
| Totali . . . | 1 | 1 | 1 | 1 | 3 | 3 | 2 | 4 | 1 | 1 | 6 | 7 | 31 |

Appare subito il forte numero insolito (7) di configurazioni che non è stato possibile far rientrare nella classificazione adottata; si deve aggiungere che anche qualche altro caso classificato non si presenta con sufficiente precisione. Qui sta una delle cause per cui maggiore del solito è il numero dei casi di precipitazioni con tipi come X, XI, XVIII, che di regola sono per il sereno.

Certo ad un'analisi più minuta appare come a queste configurazioni manca quella stabilità che è una delle loro caratteristiche e invece hanno rapide trasformazioni, come per esempio appare nei tre giorni seguenti: il 10 con tipo XVIII e precipitazioni parziali, l'11 e il 12 con tipo X e precipitazioni generali.

Nel giorno precedente, il 9, si avea una larga striscia di minor pressione attraverso l'Europa e il Mediterraneo centrale con un ciclone a Jean Mayen, altro tra Praga e Vienna e un terzo nel Mar di Levante; la striscia era compresa tra i due anticicloni quello Atlantico e quello Russo. Nei giorni successivi la striscia va restringendosi per l'avanzata dell'anticiclone atlantico.

I perturbamenti temporaleschi generali sulla regione del pomeriggio del 30 maggio pare si debbano attribuire al ritirarsi di una saccatura da E in Val Padana, dopo alcuni giorni estremamente caldi (§ 2). La curva segnata dal barometro ha un minimo nella regione durante tali perturbamenti. La configurazione isobarica di quel giorno (30) e del successivo non s'accosta a nessuna delle forme tipiche della classificazione adottata.

12. I dislivelli tra *marea* prevista con l'analisi armonica e marea realizzatasi, che negli ultimi giorni del mese precedente erano stati cm. 32, vanno attenuandosi rapidamente ai primi di questo. Nel mese corrente il dislivello più forte osservato fu di cm. 27 verificatosi alla prima bassa marea del 25 (marea reale più bassa della prevista) e cm. 20 verificatosi alla prima bassa marea dell'11 tutte e due in periodo di sizigie.

Pel rimanente del mese tra prevista e reale le differenze di livello furono di pochi cm. e le differenze di orario furono di pochi minuti.

# PLUVIOMETRIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Le tabelle contengono le osservazioni giornaliere ed i totali mensili delle precipitazioni verificatesi a tutte le stazioni della rete del Magistrato, raggruppate per **bacini principali** (o gruppi di bacini principali)

e per **pianure**, limitate dai principali corsi d'acqua della regione e così denominate:

| | |
|---|---|
| **pianura orientale** | *a*) fra Isonzo e Tagliamento |
| | *b*) fra Tagliamento e Piave |
| **pianura occidentale** | *a*) fra Piave e Brenta |
| | *b*) fra Brenta e Adige |
| **pianura polesana** | fra Adige e Po |

In apposita colonna vengono dati inoltre i nomi dei bacini secondari a cui appartengono le stazioni pluviometriche.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni pluviografiche sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dallo strumento a lettura diretta invece che dal registratore.

Le precipitazioni vengono generalmente misurate al mattino, alle ore 9, e assegnate al giorno in cui venne eseguita l'osservazione; comprendono sia la pioggia che la neve fusa.

I dati giornalieri ricavati dai diagrammi pluviografici comprendono le quantità di pioggia registrate dalle ore 9 del giorno precedente alle ore 9 del giorno che si considera.

Per ogni stazione è indicato il numero dei giorni con precipitazioni uguali o superiori ad 1 millimetro.

*Manto nevoso.* — Nella tabella vengono raccolte le altezze giornaliere del manto nevoso in cm. per alcune stazioni; per ogni stazione è segnata in grassetto la massima altezza raggiunta dalla neve durante il mese.

Su quattro cartine allegate al bollettino sono indicate le altezze del manto nevoso per alcune stazioni nei giorni indicati nelle cartine stesse.

In corrispondenza alle stazioni il cui nome per ragioni di spazio è abbreviato sono segnate in nero le quote s. l. m., ed in rosso le altezze della neve osservate in quel giorno.

Le altezze del manto nevoso vengono misurate con un'asta metrica posta nelle immediate vicinanze del pluvionivometro; esse danno quindi l'altezza del manto nevoso soltanto per il punto di misura.

### SEGNI CONVENZIONALI

P, pluviometro a superficie ricevente di $^1/_{10}$ di m.²;
Pn, pluvionivometro id. id. id. id.
Pa, pluviometro a superficie ricevente di $^1/_{20}$ di m.²;
Pv, pluvionivometro id. id. id. id.
Pr, pluviografo;

—, nessuna precipitazione;
*, neve;
•, pioggia;
n, precipitazioni avvenute sotto forma di neve non misurata;

», non giunte le osservazioni; dato mancante;
?, dato incerto;
(·), dato desunto dallo strumento a lettura diretta invece che dal registratore.

**Avvertenze.** — I valori massimi giornalieri delle precipitazioni sono indicati col carattere grassetto.

# REGIME DEI CORSI D'ACQUA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

**Altezze idrometriche giornaliere.** — Vengono raccolte in questa tabella le osservazioni eseguite agli idrometri principali, in funzione lungo i corsi d' acqua più importanti della regione.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni provviste di idrometrografo sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dalla lettura all' idrometro invece che dal registratore.

Nella II parte (annua) del Bollettino vengono riportate le caratteristiche di tutti gli idrometri della rete del Magistrato.

I valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese.

Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere *ordinario* sono *sopra* lo zero idrometrico, quelle stampate in carattere *minuscolo* e distinte dal segno — posto al di sopra di ognuna di esse, sono *sotto* lo zero idrometrico.

**Deflussi giornalieri e mensili.** — Per le principali stazioni per misure di portata vengono in questa tabella raccolti i valori seguenti: altezze idrometriche giornaliere, portate in mc. al secondo giornaliere e mensili, deflussi giornalieri e mensili.

Per le stazioni con idrometro a lettura diretta si è assunto come valore della portata giornaliera quello che corrisponde all' altezza osservata il giorno stesso all'idrometro di stazione. Per le stazioni fornite di registratore, si è assunta come portata giornaliera, quella corrispondente alla media delle altezze registrate ogni sei ore e, nel caso di notevoli variazioni del livello, quella corrispondente alla media delle altezze orarie.

I valori delle portate desunti dalle relative curve, vengono corretti mediante la curva di Stout, determinata in base alle variazioni verificatesi nelle singole sezioni.

I valori più elevati del mese sono stampati in grassetto, quelli più bassi in corsivo e sottolineati.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato e per secondo, calcolato per le portate massima, minima e media del mese.

**Misure di portata.** — La tabella riporta l' elenco ed i risultati delle misure di portata eseguite nel mese a cura dell' Ufficio. Per ognuna di esse viene indicato il bacino imbrifero in kmq. ed il contributo per kmq. in litri al secondo.

**Materiale in sospensione nell' acqua dei fiumi.** — Viene determinato e pubblicato: per l' **Isonzo** a *Salcano*, per il **Tagliamento** a *Venzone* e *Latisana*, per il **Piave** a *Belluno* (Borgo Piave), per il **Brenta** a *Bassano* e *Codevigo*, per il **Frassine** a *Borgo Frassine*, per l' **Adige** a *Pescantina* e *Boara Pisani*.

### SEGNI CONVENZIONALI

I, idrometro;
Ir, idrometro registratore;
», non giunte le osservazioni; dato mancante;

?, dato incerto;
(·), dato desunto dalle letture all' idrometro invece che dal registratore;
(··), dato interpolato;

°, idrometro o idrometrografo posto in località ov' è sentito l' influsso della marea o dell' apertura o chiusura dei sostegni di navigazione, oppure dalle manovre degli impianti per derivazione d' acqua.

(*) Nella portata unitaria e integrale è anche considerata la portata del canale di derivazione per l'irrigazione dell'Alto Agro Veronese. Tale portata, variabile continuamente, in quanto è influenzata da numerose chiaviche di presa, non è possibile determinare giorno per giorno. Risulta però trattarsi di portate che non superano mai in autunno-inverno i m.³ 3 ed in primavera-estate i m.³ 16. Calcolando per l'inverno una portata media di 2 m.³ e per la primavera-estate di 15 m.³ veniamo a commettere nel calcolo della portata integrale dell'Adige un errore del tutto trascurabile, in relazione ai limiti di tolleranza che ci siamo proposti nelle misure di portata. Nei valori delle portate e dei deflussi è inoltre considerata la portata, derivata mediante sollevamento meccanico, del canale d'irrigazione di sinistra dell'Adige.

## Misure di portata eseguite nel mese

| N. d'ordine | Bacino principale | Corso d'acqua | Località | Giorno | Idrometro | Altezza idrometrica | Sezione liquida in mq. | Portata m. c. al secondo | Bacino imbrifero in kmq. | Contributo per kmq. in litri |

# GEOIDROLOGIA

Le osservazioni freatimetriche vengono effettuate dieci volte al mese nei giorni 2-5-8-11-14-17-20-23-26-29, al mattino, prima degli ordinari attingimenti d'acqua.

Le stazioni sono elencate in relazione alla progressiva distanza dall'asse dei corsi d'acqua e procedendo da monte a valle. I nomi stampati in grassetto indicano che la stazione è fornita di apparato registratore dei livelli freatici.

Le quote del pelo d'acqua nei pozzi sono tutte riferite al livello medio del mare. Per la pianura fra Tagliamento e Torre, per quelle del Brenta e dell'Adige le quote dei pozzi sono state desunte dalle tavolette al 25.000 dell'Istituto Geografico Militare e devono pertanto ritenersi approssimate; per gli altri pozzi le quote sono state determinate mediante livellazione geometrica.

### SEGNI CONVENZIONALI

°, idrometro a lettura diretta o registratore posto in località ov'è sentito l'influsso della marea o delle manovre degli impianti per derivazione d'acqua;
», non giunte le osservazioni, dato mancante;
?, dato incerto.

## Osservazioni freatimetriche e variazioni freatiche in relazione alle condizioni idrometriche

# MAREOGRAFIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Tutte le altezze di marea pubblicate nel bollettino sono espresse in centimetri e riferite ad una superficie ideale di base situata a m. 1.50 sotto il livello medio del mare, origine della rete altimetrica dello Stato, (si ottengono così nelle altezze di marea valori sempre positivi).

Le letture dirette delle altezze di marea, per il controllo del funzionamento degli apparati registratori, sono effettuate a partire da uno speciale bullone (caposaldo) quotato mediante collegamento di precisione coi caposaldi della rete altimetrica suddetta.

Le altezze di marea di Trieste invece sono riferite, dal Gennaio 1929 in poi, ad un piano ideale posto a 150 cm. sotto il livello medio determinato dal Prof. Hopfner sulla base dei dati orari del 1911. Tale livello medio si trova a cm. 252.9 sotto il caposaldo verticale dell'I. G. M., fissato alla parete interna NE della cabina mareografica.

Per riferire al suddetto piano ideale tutti i dati pubblicati nei bollettini dell'Ufficio Idrografico dal luglio 1926 a tutto dicembre 1928 si devono aumentare i dati stessi di 5 cm.

In tal modo possiamo dare le altezze di marea riferite al livello medio del mare, che abbiamo assunto come fondamentale in prima approssimazione, in attesa di stabilirlo definitivamente, in base a lunghe serie di osservazioni mareografiche.

I tempi sono calcolati sul tempo medio Etneo (T. M. E. C.).

Le stazioni mareografiche, delle quali si pubblicano i dati, sono state scelte:

TABELLE I e II. — Per lo studio del fenomeno di marea nell'Adriatico: Marano Lagunare, Porto Falconera, Diga Sud del Porto di Lido, San Felice di Chioggia (entro il Porto di Chioggia); Trieste, Ancona, Viesti.

TABELLA III. — Per lo studio del fenomeno di marea entro la Laguna di Venezia: oltre a Diga Sud del Porto di Lido, Punta della Salute (Venezia, bacino di S. Marco), Porto industriale di Marghera. (1)

TABELLA IV. — Per lo studio del fenomeno di marea agli estremi limiti della laguna ed in relazione agli studi di bonifica: Conche (vecchie foci della Brenta in laguna di Chioggia), Pagliaga (confluenza del fiume Dese con il canale Osellino presso la foce in laguna), Brondolo (fiume Brenta, alla confluenza del canale di Valle, presso la foce).

TABELLA V. — Questa tabella dà i valori massimi e minimi raggiunti dal livello del mare nel mese, con le relative escursioni.

TABELLA VI. — La tabella dà la massima ampiezza di marea osservata nel mese, sia fra alta e bassa come fra bassa ed alta marea consecutive.

**Materiale in sospensione nelle acque lagunari.** — In questa tabella vengono raccolti i dati relativi al materiale in sospensione nelle acque lagunari all'interno dei Canali Porti di Lido e di Malamocco e precisamente in corrispondenza alle località S. Nicolò di Lido e Faro Rocchetta.

A S. Nicolò di Lido (Canale di S. Marco) i saggi vengono raccolti, sia in flusso che in riflusso, durante i periodi di tempo nei quali si ritiene che la velocità di corrente raggiunga i valori più elevati.

A Faro Rocchetta (Canale Rocchetta) i saggi vengono raccolti in prossimità dell'alta e della bassa marea.

La torbidità è espressa in *grammi per metro cubo* (gr./ m.$^3$).

I dati suddetti, rilevati in un determinato istante ed in un singolo punto della laguna, possono dare soltanto una nozione molto approssimata sul trasporto del materiale di sospensione nelle acque lagunari; essi potranno inoltre fornire degli elementi di guida per le ricerche future.

**Salsedine delle acque lagunari.** — Nella tabella vengono raccolti i dati della salsedine delle acque lagunari, rilevati nella mezzaria del Canale di S. Marco tra S. Nicolò di Lido e l'isola di S. Andrea, in corrispondenza delle massime alte e delle minime basse maree di ciascun periodo sigiziale, limitato dai tre giorni che comprendono ogni lunazione. I dati suddetti vengono raccolti allo scopo di definire le variazioni a lungo periodo della salsedine in laguna.

La salsedine è espressa in Cl. ‰ (quantità di cloro in grammi per litro) *ed in salinità* S (quantità di sali in grammi per chilo di acqua).

### SEGNI CONVENZIONALI

», dato mancante; — (••), dato interpolato o calcolato in base ad osservazioni interpolate; — ?, dato incerto.

(1) Rendendosi necessari alcuni lavori alla stazione mareografica di Marghera, situata all'imboccatura del Canale Vittorio Emanuele III, a fianco dell'Emporio dei Sali e Tabacchi, a partire dal mese di Luglio 1928 sono stati utilizzati per lo spoglio e vengono pubblicati i dati mareografici dei diagrammi della seconda stazione pure di Marghera, situata alla Darsena W.
Le quote dei bulloni di riferimento della nuova stazione sono le seguenti:

Bullone interno m. 2,4707 s. l. m. m.
Bullone esterno m. 2,0687 s. l. m. m.

N.B. — I dati sottolineati si riferiscono ad osservazioni influenzate da ondulazioni secondarie di una certa entità.

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Dei vari Osservatori costituenti la Rete Meteorologica del Magistrato alle Acque si pubblicano le osservazioni di alcuni soltanto, scelti in modo da dare un'idea sull'andamento dei principali fenomeni meteorologici della Regione che hanno interesse più o meno diretto con l'Idrologia. Gli stessi criteri hanno servito per la scelta delle stazioni termometriche.

Le osservazioni nella Rete del Magistrato alle Acque si eseguono alle ore 8, 14 e 19 T. M. E., in accordo con l'orario internazionale per le osservazioni sinottiche.

Tutti gli Osservatori sono muniti di strumenti registratori, e alle ore indicate si fanno le letture, tanto ad essi, come agli strumenti a lettura diretta, in modo da apportare in seguito le correzioni del caso.

*Gli strumenti registratori* da cui si fanno gli spogli sono:

*per la pressione:* il barometrografo Agolini;

*per la temperatura:* il termografo, e *per l'umidità:* l'igrografo, tutti e due della ditta Richard;

*per il vento:* l'anemografo Steffens - Marini, ovunque, tranne all'Osservatorio di Treviso e quello del Lido, ove lo spoglio è desunto da un anemografo ad 8 direzioni del Richard;

*per le precipitazioni:* pluviografo Palazzo, oppure tipo M dell'Ufficio Idrografico.

Negli Osservatori principali sono in funzione anche altri tipi di registratori, ai quali si ricorre per l'eventuale interpolazione dei dati, nel caso d'interruzione agli strumenti comuni.

Gli strumenti, tarati all'atto della distribuzione, vengono di quando in quando verificati e controllati.

**Per tutti gli elementi meteorologici, di cui si dà conto nella presente parte « Meteorologia », a differenza di quello che si fa nell'altra parte « Pluviometria », si adotta il giorno civile dalle 0 alle 24.**

Dei diagrammi del termografo, igrografo, barografo si fa lo spoglio, ossia la lettura delle ordinate, ogni due ore.

La media relativa viene calcolata con la formula:

$$m = \frac{1}{12}(l_0 : 2 + l_2 + l_4 + \ldots + l_{22} + l_{24} : 2)$$

Alla media così calcolata si apporta la *correzione* ricavata dal diagramma delle correzioni, ottenuto portando sulle ascisse le letture fatte sul registratore, e sulle ordinate le correzioni dedotte dai confronti con le osservazioni agli strumenti a lettura diretta. Tale metodo si è trovato più rapido e più opportuno di quello di applicare giorno per giorno la correzione ricavata, oppure alla media dell'elemento la media aritmetica delle correzioni.

Per il *vento* si fa lo spoglio ogni ora.

Nella relativa colonna *è segnata la direzione prevalente del vento,* ossia la direzione secondo la quale esso ha soffiato per un maggior numero di ore durante la giornata.

La *media giornaliera* della velocità del vento, espressa in km. ora, è calcolata secondo la formula:

$$m = \frac{1}{24}(l_1 + l_2 + \ldots + l_{23} + l_{24})$$

Per due Osservatori, Belluno, Vicenza e per quelli di II° ordine, non ancora forniti di anemografo, la direzione e forza del vento sono stabilite a stima dall'osservatore.

Per ogni Osservatorio viene pubblicato la massima e minima temperatura giornaliera.

La *nebulosità* è espressa in decimi di cielo coperto, ed è la media aritmetica delle tre osservazioni.

*Note meteorologiche del mese.* — Vengono suggerite dall'esame dei dati raccolti negli Osservatori meteorologici e nelle Stazioni pluviometriche del Compartimento, e delle carte isobariche che si pubblicano nel Bollettino giornaliero dell'Ufficio; queste carte vengono talvolta rettificate in base alle pubblicazioni degli Uffici Meteorologici italiani ed esteri.

I numeri romani preceduti o no dalla parola - tipo - si riferiscono alla classificazione del Fabris (1) alla quale sono state portate leggere modifiche specialmente nei riguardi dei tipi III, XV e XVII.

I valori medi dei vari elementi meteorologici sono stati desunti in generale dai lavori del Prof. F. Eredia pubblicati negli Annali dell'Ufficio Centrale di Meteorologia e Geodinamica di Roma e si riferiscono ad oltre un trentennio di osservazioni. Soltanto per il Venda i valori medi sono stati dedotti da un decennio di osservazioni.

### SEGNI CONVENZIONALI

● Pioggia. - ✳ Neve. - △ Nevischio. - Gragnuola - ▲ Grandine. - ≡ Nebbia. - :≡ Nebbia piovigginosa. - ≡ Nebbia all'orizzonte. - V Brina. - ⌴ Gelo. - ∾ Gelicidio. - ⌓ Rugiada. - ·· Aghi di ghiaccio. - ∞ Caligine. - ⟙ Temporale. - T Temporale lontano. - < Lampi senza tuoni. - ⟩ Lampi e tuoni. - ⥂ Vento forte. - ⥂ Vento fortissimo. - ⨦ Uragano di neve. - ⊖ Alone solare. - ⋲ Alone lunare. - ⊕ Corona solare. - ⋳ Corona lunare. - ⌒ Arcobaleno.

—, calma, o nessuna precipitazione;

», non giunte le osservazioni; dato mancante o non calcolato;

?, dato incerto;

(•), dato desunto dallo strumento a lettura diretta, invece che dal registratore; se il segno è messo in testa ad una decade, vale per tutti i dati successivi di quella decade;

••, dato interpolato o calcolato in base ad osservazioni interpolate;

Le lettere a p n, che seguono alcuni segni (quei di nebbia, pioggia, neve, grandine, temporale, lampi, tuoni), indicano la parte del giorno (rispettivamente dalle ore 8 alle 12, dalle 12 alle 19 e dalle 19 alle 8), in cui il fenomeno si è verificato.

Se il segno di pioggia, neve, nebbia non è seguito da *nessuna lettera,* vuol dire che il fenomeno ha durato tutto il giorno.

**Avvertenze.** — I valori massimo e minimo dei singoli elementi per ogni decade sono indicati col carattere grassetto.

(1) C. Fabris — Tipi isobarici principali e loro azione sull'Italia — Lit. del Serv. Aer. — 1917.

# Note meteorologiche del mese di Giugno

(Redatte dal Prof. Dott. G. Crestani)

1. La *media mensile della temperatura* è stata, anche in questo mese come nel precedente, dapertutto superiore al valor medio dedotto da molti anni. L'eccesso s'è aggirato in generale attorno ad un grado, tranne che a Treviso (0°,5), a Bolzano (1°,6) e al Venda (1°,8).

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Venda | Rovigo | Vicenza | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Giugno 1929 | 20,0 | 22,3 | 21,5 | 19,4 | 22,4 | 22,2 | 22,2 | 18,7 | 22,6 | 22,4 | 21,2 | 22,0 |
| Val. medio | 18,9 | 20,8 | 20,6 | 18,3 | 21,9 | 21,2 | 21,0 | 16,9 | 22,0 | 20,9 | 20,4 | 20,4 |

2. Nel *suo andamento generale la temperatura*, che ai primi del mese avea continuato la diminuzione del mese precedente, sale in seguito rapidamente, e si mantiene elevata in tutta la seconda decade; a questa spetta la media più alta di tutte le tre decadi, perchè sulla fine la temperatura torna a diminuire e la media decadica in generale è la più bassa del mese; in qualche località anzi in questo periodo furono segnate anche le minime più basse del mese.

Difatti le massime temperature cadono nei giorni 10 (Venda 26°,5), 17 (Padova 31°,2, Venezia 30°,8), 18, 20. Le minime del mese in alcune località, come nell'Istria, si presentarono il 5 e 6, altrove al 26 (Venda 8°,6, Venezia 13°,7), al 27 a Bolzano, al 29 a Padova 12°,2, ecc.

L'escursione mensile è stata di 17°,9 al Venda, 16°,6 a Venezia, 19°,0 a Padova.

3. In sei giorni (3-4 14-15-16-24) la *temperatura minima* del Venda *fu superiore* a quella a Padova; le differenze però furono sempre molto piccole, le maggiori 1°,2 al 3, e 1°,1 al 14.

L'altezza dell'isoterma zero nell'aria libera, data la temperatura al suolo, è di certo più alta dei 3000 m., ossia delle cime più alte della regione. L'estrapolazione dei dati al suolo assumendo come decremento della temperatura lungo la verticale quello dell'aria libera in Val Padana, come si praticava nei mesi più freddi, per un tratto così lungo, è troppo incerta e la si lascia.

Distribuendo gli Osservatori e le stazioni termometriche in pianura e in montagna in vari gruppi a seconda delle loro quote, si hanno i seguenti valori medi della temperatura.

| Altezza m. sul livello del mare | 31 | 311 | 576 | 950 | 1250 | 1508 | 1793 | 2152 |
|---|---|---|---|---|---|---|---|---|
| Temper. media prima decade . | 21,2 | 20,2 | 18,1 | 17,3 | 14,7 | 13,7 | 11,6 | 10,7 |
| Temper. media seconda decade . | 24,7 | 23,0 | 20,8 | 20,1 | 16,9 | 16,2 | 13,3 | 13,3 |
| Temper. media terza decade . . | 20,7 | 19,4 | 16,9 | 17,0 | 14,3 | 12,9 | 11,0 | 10,4 |
| Temperatura media mensile . . | 22,2 | 20,9 | 18,6 | 18,1 | 15,3 | 14,3 | 12,0 | 11,5 |

Il termometro è sceso sotto zero solo alle quote superiori ai 2000 m. nei primi del mese, nel resto fu sempre sopra zero.

4. Pochi furono i giorni in cui più o meno diffuse nella regione non siano cadute delle precipitazioni, specie nella parte montuosa; queste mancarono quasi del tutto nei giorni 2, 3, 4, 7, 8, 11, 12, 14, 18, 19, 20, 29. Dal 21 al 28 decorre un periodo a precipitazioni ininterrotte (generali al 21, 22 e 26); al 30 poi riprendono le precipitazioni generali. Tra le quantità maggiori vanno ricordate: al giorno 1 mm. 40,2 a Padova, al 5 mm. 54,8 a Venezia (Lido), al 5 (g. p.) mm. 93,6 a Plezzo, mm. 83,0 a Caporetto, mm. 181,4 a Venzone (*totale diurno massimo del mese*); al 24 mm. 71,8 a Pisino, al 25 mm. 51,6 a Gorizia, al 26 (g. p.) mm. 99,8 a Caporetto, mm. 87,3 a Piedicolle, mm. 31,6 a Pontebba; al 29 (g. p.) mm. 33,2 a Borgo (bacino del Brenta).

Al 5 si presenta un incremento di livello rapido nell'Isonzo, appena avvertibile negli altri fiumi; altro leggero incremento è segnato dall'Adige al 9, l'idrometro poi si mantiene al livello raggiunto al 10 (m. 2,29 a Trento) con leggere oscillazioni sino al 14, per poi discendere; altro leggero e rapido aumento infine è segnato verso la fine del mese, che raggiunge il massimo al 25 nel Livenza, e al 26 nell'Isonzo.

5. Nessuna delle stazioni (la più alta è Monteneve m. 2332) ha segnalato *neve*, quindi il manto nevoso è ridotto solo a quote superiori e nei luoghi riparati.

6. La *media mensile della nebulosità* in generale si scosta di poco dal valor medio; le maggiori differenze sono in difetto a Belluno, Venezia, Trieste; in eccesso a Pisino, Treviso, Padova, Vicenza.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Vicenza | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|
| Giugno 1929 | 5,9 | 4,5 | 5,1 | 5,1 | 5,7 | 4,6 | 5,8 | 5,3 | 6,0 | 5,1 |
| Val. medio | 4,5 | 5,3 | 5,0 | 7,0 | 5,2 | 5,4 | 4,8 | 4,5 | 5,9 | 5,1 |

7. La *quantità delle precipitazioni* cadute in questo mese in generale è inferiore al valor medio: solo si hanno valori superiori qua e là, conseguenza di qualche acquazzone come a Pisino, dove caddero mm. 71,8 il 24, a Venezia mm. 54,8 il 5, a Padova mm. 40,2 il 1°, e 36,0 il 21, ecc. valori tra i massimi di queste località. Tali acquazzoni spesso sono limitati ad aree ristrette, come appare anche nella carta delle isoiete nel cui tracciamento, naturalmente, non si è tenuto conto di essi, quantunque per vari argomenti le loro misure si possano ritenere come sicure.

| | Fiume | Pisino | Pola | Trieste | Gorizia | Plezzo | Belluno | Conegliano | Treviso |
|---|---|---|---|---|---|---|---|---|---|
| Giugno 1929 | 89,5 | 159,2 | 29,0 | 89,0 | 144,0 | 253,6 | 108,8 | 72,8 | 19,0 |
| Valore medio | 129,0 | 117,2 | 68,0 | 102,4 | 177,0 | 258,2 | 132,2 | 132,5 | 113,6 |
| Rapporto | 0,69 | 1,36 | 0,43 | 0,87 | 0,81 | 0,98 | 0,82 | 0,55 | 0,17 |

| | Venezia | Padova | Rovigo | Vicenza | Recoaro | Trento | S. Michele | Bolzano | Silandro |
|---|---|---|---|---|---|---|---|---|---|
| Giugno 1929 | 126,2 | 112,5 | 16,8 | 46,6 | 114,3 | 28,8 | 29,9 | 49,0 | 30,6 |
| Valore medio | 73,7 | 84,1 | 70,2 | 119,2 | 206,0 | 97,7 | 85,2 | 78,9 | 51,0 |
| Rapporto | 1,71 | 1,34 | 0,24 | 0,39 | 0,55 | 0,29 | 0,35 | 0,62 | 0,60 |

8. Quanto è stato detto nel § precedente, naturalmente, deve essere tenuto presente durante l'esame della carta delle isoiete. Da questo esame appare lungo la solita fascia di massimi due aree di massimo notevoli: una racchiudente le sorgenti del Chiampo ed Agno e gli alti Lessini, (mm. 145 Posina), un'altra più estesa e più importante comprendente il bacino medio del Tagliamento, l'alto bacino dell'Isonzo e dei suoi affluenti di destra delimitata dalla isoieta 200; nel suo interno un'area più ristretta è racchiusa dalla isoieta 300 mm., (Caporetto mm. 327, Bergogna mm. 340, *totale mensile massimo della regione*). Le alpi Giulie hanno precipitazioni relativamente basse, attorno ai 150 mm.; la parte occidentale e meridionale dell'Istria è sotto ai 100 mm. (Trieste mm. 88, Parenzo mm. 57,1), la punta meridionale è sotto ai 50 mm. (Pola mm. 29).

La pianura Veneta tra Adige e Po (Rovigo mm. 16) e la parte ad Ovest dei Colli Euganei sino al Piave (Venezia esclusa) (Treviso mm. 19,0) è sotto ai 50 mm.

Nella regione montuosa è sotto ai 50 mm. tutta la parte occidentale, compresa la vallata dell'Adige, da Rovereto a Bolzano (Trento mm. 29, Malè mm. 51) e la Val Venosta; invece sono sopra i 100 mm. la Val Pasiria, la Val Sarentina (Sarentino mm. 159), parte della vallata dell'Isarco (Bressanone mm. 107, Riva di Tures mm. 158).

9. La *media diurna del vento* ha raggiunto ed oltrepassato i 20 km. ora al Venda in 8 giorni (3-4-5-12-13-24-25-26); i venti prevalenti furono orientali o del 1° quadrante il 5-12-26, occidentali negli altri giorni; a Venezia tale limite fu oltrepassato in 3 giorni: il 5 vento prevalente SSW, il 25 e 26 vento orientale; a Trieste in 7 giorni 5-11-12-18-25-26-27; sempre vento orientale e dal 1° quadrante, tranne il 25 in cui spirarono venti del 2° quadrante.

In tutta la regione il vento raggiunse particolare violenza il giorno 26: al Venda media diurna km./h 45,6, massima 65 da NE; a Venezia km./h 33,3, massima 56 (dalle 2 alle 3) da ENE; a Trieste km./h 41,8, massima diurna 64 (dalle 1 alle 2). A Trieste nel giorno precedente (25) la massima era stata km./h 67 dalle 23-24; tutti questi massimi sono i massimi mensili delle località.

Anche a Padova quel giorno 26 fu il più ventoso del mese, avendosi avuto una media di 11,8, a Rovigo 19,2; vento prevalente in questo giorno tra ENE e NE in tutte le località.

La configurazione barica caratteristica del giorno 26 era tipo XVI a, ossia ciclone a mm. 754 sul Golfo di Genova, con un promontorio (dipendenza dell'anticiclone centrato ad W delle isole Britanniche) che si stendeva a Nord delle Alpi avanzando sino ai Balcani; mentre al giorno precedente l'anticiclone era più a Nord e il promontorio meno pronunciato; un ciclone a mm. 753 si trovava sull'alto Adriatico (apportatore di copiose piogge) in saccatura da E, dipendenza di ciclone a mm. 745 centrato nel Golfo di Finlandia.

Dall'esame della *rosa dei venti* a 16 direzioni, costruita con lo spoglio orario delle registrazioni dell'anemografo, risulta:

A Fiume la minore frequenza è alle direzioni comprese tra ESE e SSW (14 % a 5 direzioni); rispetto ai mesi precedenti è leggermente aumentata la frequenza nel 3° quadrante, i massimi soliti non spiccano sulle direzioni vicine così fortemente come le altre volte.

A Trieste si ripete la solita rosa: 17 % a ciascuna delle due direzioni E ed ENE, 17 % a SE e 24 % alle quattro direzioni da W a NNW.

A Venezia sono scarse le direzioni occidentali da S a N (22 % a 9 direzioni); tra le altre esiste un massimo a SSE (23 %), un secondo a ESE (10 %); poca è la differenza fra le 3 direzioni ENE, NE ed NNE (complessivamente a tutte e 3 spetta 33 %.

Al Venda è aumentata rispetto ai mesi precedenti la frequenza delle direzioni nel 2° quadrante; difatti spetta 56 % alle 3 direzioni da E a NE, 20 % alle direzioni SE e SSE e 17 % alle direzioni SW e WSW.

A Padova rispetto ai mesi precedenti, la rosa è ruotata verso levante; difatti scarsa è la frequenza delle direzioni da S a NNW (30 % a 8 direzioni), delle altre la NNE e la NE poco differiscono fra loro due e insieme hanno 26 %; si nota un massimo secondario a E (11 %) e un altro a SSE 8 %.

A Trento la rosa va assumendo la sua forma estiva con la larga estensione del lobo nel 2° quadrante; difatti a SSE spetta 14 %; alle due direzioni NW e NNW 19 % per ciascuna, e a ENE 23 %.

10. La *media mensile della pressione atmosferica* di questo giugno è sensibilmente uguale al valor normale; difatti l'altezza barometrica di questo mese a Venezia è mm. 760,9 mentre il suo valor normale è mm. 760,8, un eccesso quindi di soli mm. 0,1.

Il valor massimo raggiunto dall'altezza barometrica è stato di mm. 768,6 alle ore 9 del 12; l'altezza minima è stata di mm. 749,3 alle ore 20 del 25; l'ampiezza dell'escursione, pertanto, è di mm. 19,3, superiore all'ampiezza media del mese nella regione, che s'aggira attorno ai 14 mm.
